

RITIS User Group

Web Meeting | May 20, 2021

Welcome!

- We are using Zoom **Webinar**
- **AUDIO (Computer):** Use your computer speakers and microphone by clicking the “Join Audio” button at the bottom left of the screen. You will be muted.
- **Alternate Audio (Phone):** Call into the meeting by dialing the phone number based on your location (provided in the confirmation email) and enter the Meeting ID at the prompt. You will be muted.
- **This web meeting is being recorded.**
- **Questions** with the audio or web? Please contact Esther directly via the chat box or email (ekleit@kmjinc.com)

Using the Q&A box and Chatbox

- Use the **Q&A box** to ask presenters questions
- Ex. “How accurate is the captured data?”

- Use the **chatbox** for technical issues or to contact Coalition staff
- Ex. “I can’t hear the presenter”

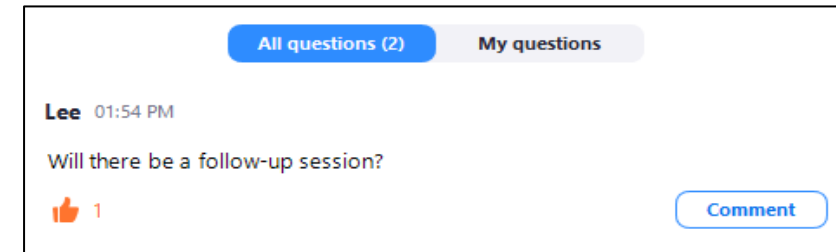

Asking Questions in the Q&A Box

- Click on the Q&A icon at the bottom of your screen

- The questions in the Q&A box will be monitored and answered either between presentations or at the end of the meeting
- You can keep track of your questions in the “My Questions” tab in the Q&A box

Asking Questions Verbally

- Please raise your hand (*click on the hand icon at the bottom of the screen*), and a host will unmute you.
- Please give your name and agency before asking your question
- **Please mute yourself when you are finished asking a question**

Coalition Update

Denise Markow

The Eastern Transportation Coalition
TSMO Director

— **THE EASTERN
TRANSPORTATION
COALITION**

CONNECTING FOR SOLUTIONS

Coalition Update

RECENT

- **Waze Workshops** - February 24 & March 3, 2021
- **PDA Suite PMs Summary Group Meeting** - March 5, 2021
- **TVER Mobile App Vendor Forum #1** - March 11, 2021
- **CAV Workshop including Freight** - March 23, 2021
- **Traveler Info Services Virtual Summit** - April 1, 2021
- **RITIS Product Enhancement Working Group Meetings** - April 8 & May 6, 2021

UPCOMING

- **Tolling Mobile App Vendor Forum #2** - June 3, 2021
- **Coalition Strategic Cross-cutting Session** - June 8, 2021
- **Waze Working Group Meeting** – June 15, 2021
- **VPP/TDM Bi-Annual State Meeting** – June 22, 2021
- **RITIS User Group Meeting** – July 2021
- **Traffic Data Marketplace (previously VPPIII) RFP Meetings** – July/August 2021

Welcome & Introductions

Jesse Buerk

Delaware Valley Regional Planning Commission
User Group Co-chair

Today's Meeting

Welcome and Introductions	Jesse Buerk, DVRPC & User Group Co-chair
Spotlight Presentation: Update on the Transportation Disruption and Disaster Statistics	Mark Franz, UMD CATT Lab
Spotlight Presentation: COVID-19 Impacts on Travel Trends Using the RITIS-PDA Suite	Tom Edinger, DVRPC
New RITIS Tools and Recent Enhancements	Michael Pack, UMD CATT Lab
RITIS Product Enhancement Working Group Update	Denise Markow, TETC for Matt Glasser, Georgia DOT
PDA Suite Performance Measures Working Group Update	John Allen, UMD CATT Lab
Agency Input Session	Michael Pack, UMD CATT Lab
Wrap Up and Remaining Questions	Jesse Buerk

Today's Speakers

Michael Pack
UMD CATT Lab
Director

Tom Edinger
DVRPC
Manager, Congestion Management Programs

Mark Franz
UMD CATT Lab
Lead Transportation Analyst

John Allen
UMD CATT Lab
Faculty Assistant, Outreach & Education

Meeting Participants

Agencies

AEMCorp	DVRPC	Jacobs Engineering Group, Inc.	Massachusetts DOT	New Jersey DOT	Office of Intermodal Planning and Investment	SEMOG	TRANSCOM
Atlanta Regional Commission	East-West Gateway Council of Governments	Kingsport MTPO	Metric Engineering, Inc	New Jersey Sports & Exposition Authority	Ohio DOT	Southwest Research Institute	University of Maryland CATT Lab
Baltimore Metropolitan Council	Federal Highway Administration	Kittelson & Associates	MetroPlan Orlando	New York City DOT	Oregon DOT	Southwestern Pennsylvania Commission	US DOT - Bureau of Transportation Statistics
CAMPO (Raleigh)	Florida DOT	Knoxville Regional TPO	Michigan DOT	New York State DOT	Paulding County DOT	St. Charles County Government	Vermont AOT
Central Texas Regional Mobility Authority	Florida's Turnpike Enterprise	Lumin8 Transportation	Minnesota DOT	New York State Thruway Authority	Pennsylvania DOT	State of Rhode Island	Virginia DOT
Charlotte DOT	Georgia DOT (CHA)	Madera County Transportation Commission	Montgomery County Planning Department	New Jersey DOT	Pioneer Valley Planning Commission	State of Rhode Island - Division of Statewide Planning	Washington County, Oregon
City of Alexandria, VA	Georgia Environmental Protection Division	Maricopa Association of Governments	MWCOG	NJTPA	Regional Transportation Commission of Southern Nevada	Tennessee DOT

Connecticut DOT	Illinois DOT	Maryland State Highway	Nashua Regional Planning Commission	North Central PA Regional Planning & Development Commission	Rockingham Planning Commission/MPO	Texas DOT (SwRI)	
District DOT	INRIX	Maryland Transportation Authority	National Renewable Energy Laboratory	North Central Texas Council of Governments	San Diego Association of Governments (SANDAG)	The Springfield-Sangamon County	

Update on the Transportation Disruption and Disaster Statistics

Mark Franz
UMD CATT Lab
Lead Transportation Analyst

Transportation Disruption and Disaster Statistics (TDADS)

Identifying and Quantifying the Causes of Congestion

PHASE 2 UPDATE

MAY 20, 2021

Today's topics

- TDADS Project Objectives
- TDADS Phase 1 Contributions
- Review of CO and PA studies
 - Similarities and differences
- Phase 2 TDADS Work
 - Updates on Task 1-4 & 7
 - Next Steps

Moving Past old assumptions

The congestion pie chart is:

- A national statistic
- 14+ years old
- Largely modeled
- In a nutshell... outdated

TDADS project goal/objectives

Goal

“Create a method to compile and archive operational related information into a data system that can support the goal of standardization of transportation system disruption, resilience and disaster statistics nationally.”

Objectives

- Upgrade the ancient “pie chart”
 - Across entire NHS
 - Provide consistent data sources across the country
 - One full year of data - 2019
- Create an interactive, easily-accessible tool and put it in the hands of decision-makers
- Practitioner Steering Committee guides ALL work

Arizona Aug 2018 - Nov 2019

[View States](#)

\$120.12k Total UDC (0.9% of US)

51.09k Total Vehicle Hours of Delay (0.8% of US)

TDADS phase I contributions

- **Identification** of where disruptions occur
- **Assessment** of multiple national-level data sources
- **Conflation** of NWS and Waze data to road network map
- **Linkage** of traffic signals to vehicle probe data
- **Separation** of multi-events into actionable information
- **Automated** method to determine disruption root cause(s)
- **Visualization** approach for national, state and by month

TDADS is an on-line tool that uses real-world data to understand causes of congestion

TDADS Phase I transitioning to better analytics

Then

National Congestion Pie Chart (2004)

■ Bottlenecks ■ Incidents ■ Bad Weather ■ Work Zones ■ Poor Signal Timing ■ Special Events

Now

Colorado

24% multi-factor

Maryland

29% multi-factor

Note:

1. The 2004 categories in the chart above were renamed to match the TDADS charts for CO and MD
2. The MD and CO results include multiple causes and unclassified disruption, the 2004 study did not

TDADS Phase II process

Continue engagement of the Steering Committee for guidance throughout the Phase II process

- 1 Procure 1-min probe data from INRIX**
(Produce national & state charts)
- 2 Implement Geographic & Temporal Improvements**
(County & monthly level)
- 3 Develop Requirements**
(For deep-dive analytics)
- 4 Conduct a National Webinar**
(Showcase the TDADS tool)

Comparing Congestion Methodologies

Activity	Colorado	Pennsylvania	TDADS
Scope / Purpose	Travel time reliability One state Hand selected study sites (Interstate and US Rts)	Travel time reliability One state Core network	Disruption analysis National NHS
Data Source(s)	State reliant	State reliant with some WAZE Weather nearest RWIS	National sources (WAZE, NOAA radar, OSM traffic signal database)
Identify Disruption	Similar approaches: identify incident based on speed drop for a certain duration		
Quantify Disruption	Planning time-index, buffer time index, and misery index	Based on surrogate for travel time (queue length X speed drop)	Includes volumes
Determine Cause of Disruption	ONE cause assigned 4 causes: incidents, work zones, weather, special events No recurrent, No signal	ONE cause assigned 8 causes: recurrent, incidents (minor, crash, other), work zones, weather, rubbernecking, unknown No signal, or holiday	One cause OR Multi-factor Recurrent, incident, weather, work zone, signals, holiday

Take-aways from the CO & PA studies

- There is a sense of urgency to set a methodology standard
- Agencies independently developing “pie charts” may lead to misleading & confusing results
- Having to develop disruption charts on their own is problematic and challenging

TDADS helps with all these things

- 

Task 2 The Steering Committee

Steering Committee Membership

State DOTs, MPOs and key federal partners (see next slide)

Committee Role

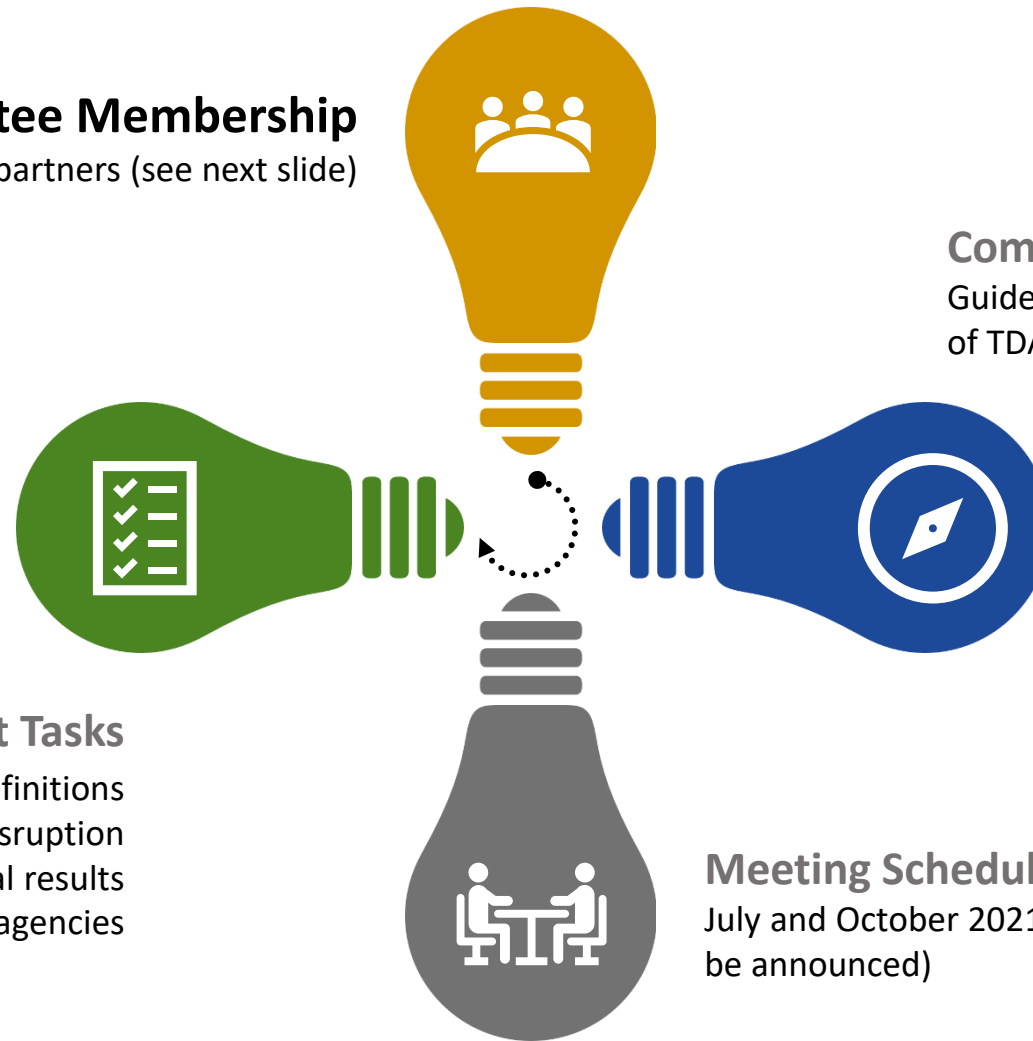

Guide the development, refinement, and next steps of TDADS to ensure the tool is useful to practitioners

Project Tasks

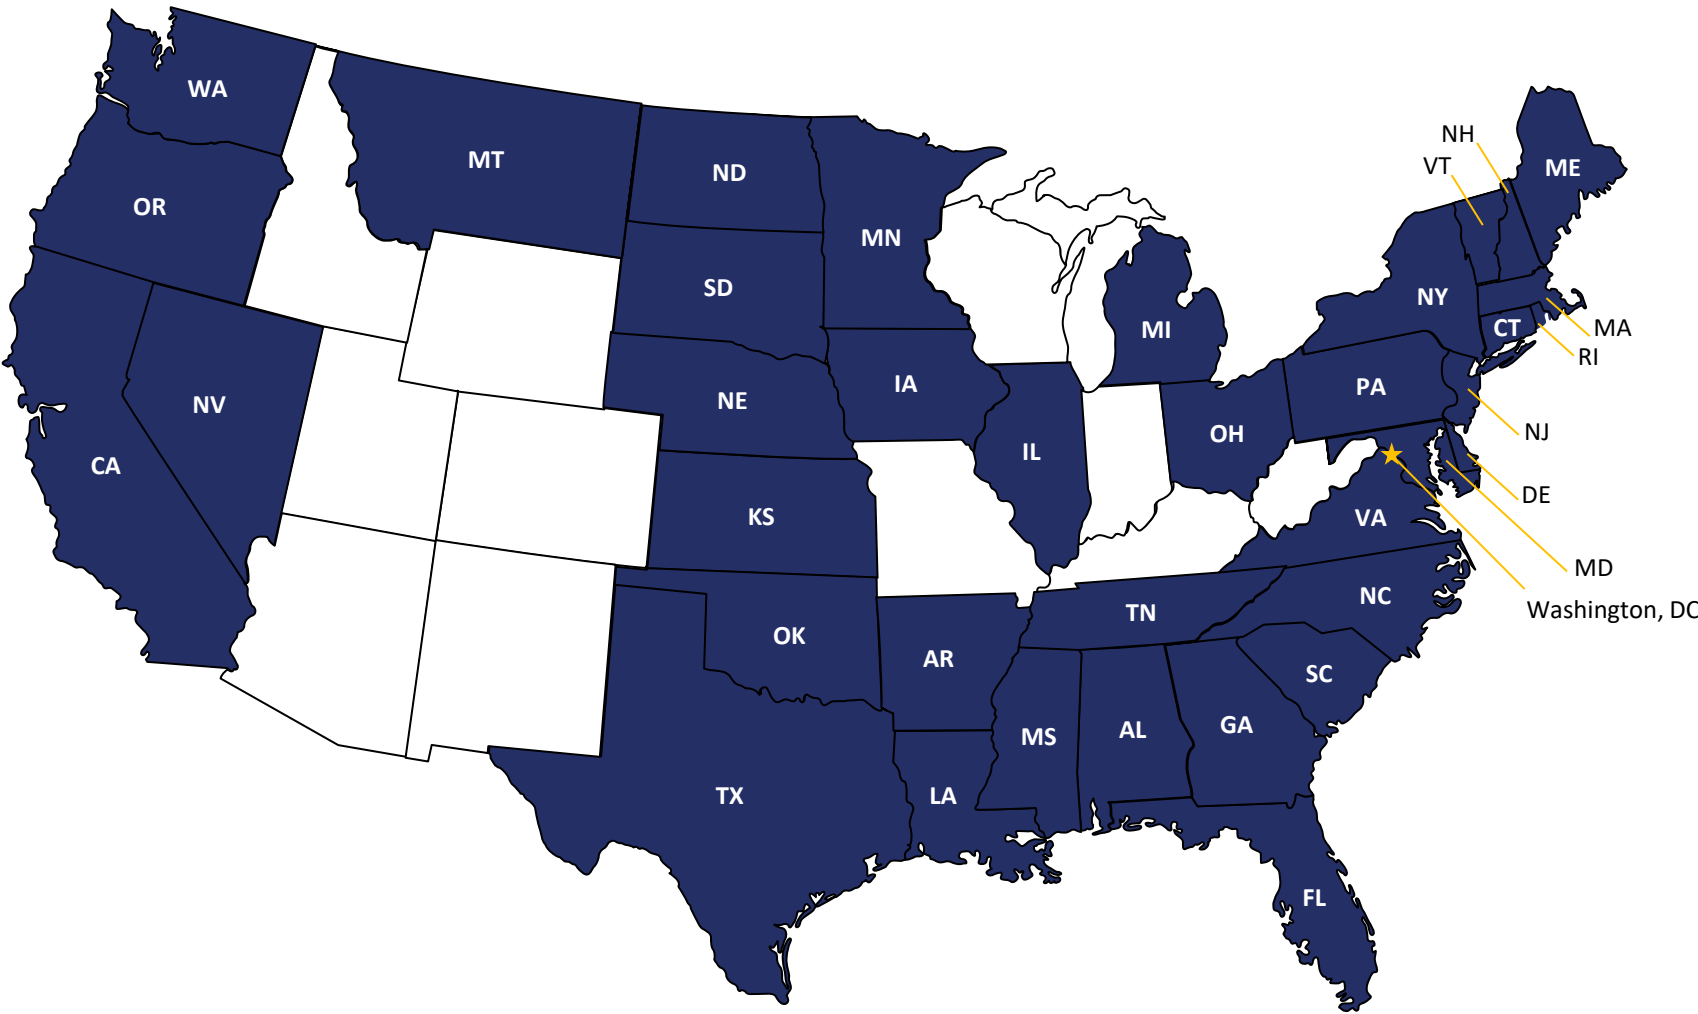

- ✓ Assessed TDADS terminology & definitions
- ✓ Provided feedback on causes of disruption
- Providing feedback on national results
- Will promote the use of TDADS for agencies

Meeting Schedule

July and October 2021 (specific dates and times to be announced)

Task 2 Steering Committee members

AASHTO	MWCOG
Alabama DOT	Nebraska DOT
Arkansas DOT	Nevada DOT
Baltimore Metropolitan Council	New Hampshire DOT
Birmingham MPO (AL)	New Jersey DOT
California DOT	New York State DOT
City of Charlotte, NC	North Carolina DOT
Connecticut DOT	North Dakota DOT
Connecticut Metropolitan COG	Ohio DOT
Delaware DOT	Oklahoma DOT
District DOT	Pennsylvania DOT
DVRPC	Rhode Island Statewide Planning
Florida DOT	South Alabama Regional Planning Commission
Georgia DOT	South Carolina DOT
Iowa DOT	South Dakota DOT
Kansas DOT	South Jersey Transportation Planning Organization
Louisiana DOT	Tennessee DOT
Maine DOT	Texas DOT
Maryland DOT - SHA	University of Alabama
Massachusetts DOT	University Of Maryland CATT Lab
Michigan DOT	Vermont AOT
Minnesota DOT	Virginia DOT
Mississippi DOT	Washington State DOT
Montana DOT	

47 Member Organizations | 35 State DOTs | 9 MPOs | 2 Universities | 1 National Assoc.

Task 3 Procure INRIX data

A Lengthy Process

✓ Completed

- Prep packaging of data (by INRIX)
- Transmission of data to CATT Lab
- Download
- Pre-processing

⚙ In Process

- QA/QC
- Loading into CATT Lab Hadoop infrastructure
- Bottleneck processing & congestion identification

NOTE: Data can only be used for TDADS pie chart reporting purposes

Task 4 Process disruption statistics nationally

Phase I (Completed)

MD & CO congestion was processed “manually”

Identify

Leveraged the Bottleneck Ranking Methodology

Quantify

Leveraged the User Delay Cost (UDC) Methodology

Categorize

Matched to congestion cause data (time and location)

(Developed annual state breakdowns)

Phase II (Current)

National Analysis w/Partial Automation

Automate the identification and quantification steps

National, State & County Breakdowns

with custom monthly time ranges

Data Item	Maryland Data	Colorado Data	Phase 1 Data (MD & CO)	Phase 2 Data (National)
NHS TMC segments	6,735	6,479	13,214	368,798
Waze Events	3.3 Million	1.3 Million	4.6 Million	101 Million

Task 7 Implement geographic improvements

	Control Type	Current UI	Enhanced UI
	Temporal	Temporal resolution is limited to “annual”	<ul style="list-style-type: none">• Year• Month• Continuous range (multi-month)
	Viz Style	There is a “sort-by” functionality	<ul style="list-style-type: none">• Nation > State > County• Bar chart and pie chart
	Geographic	National or Statewide geographic resolution only	<ul style="list-style-type: none">• Nationwide• State• County
	Sorting	Filtering by State	Filtering by geographies

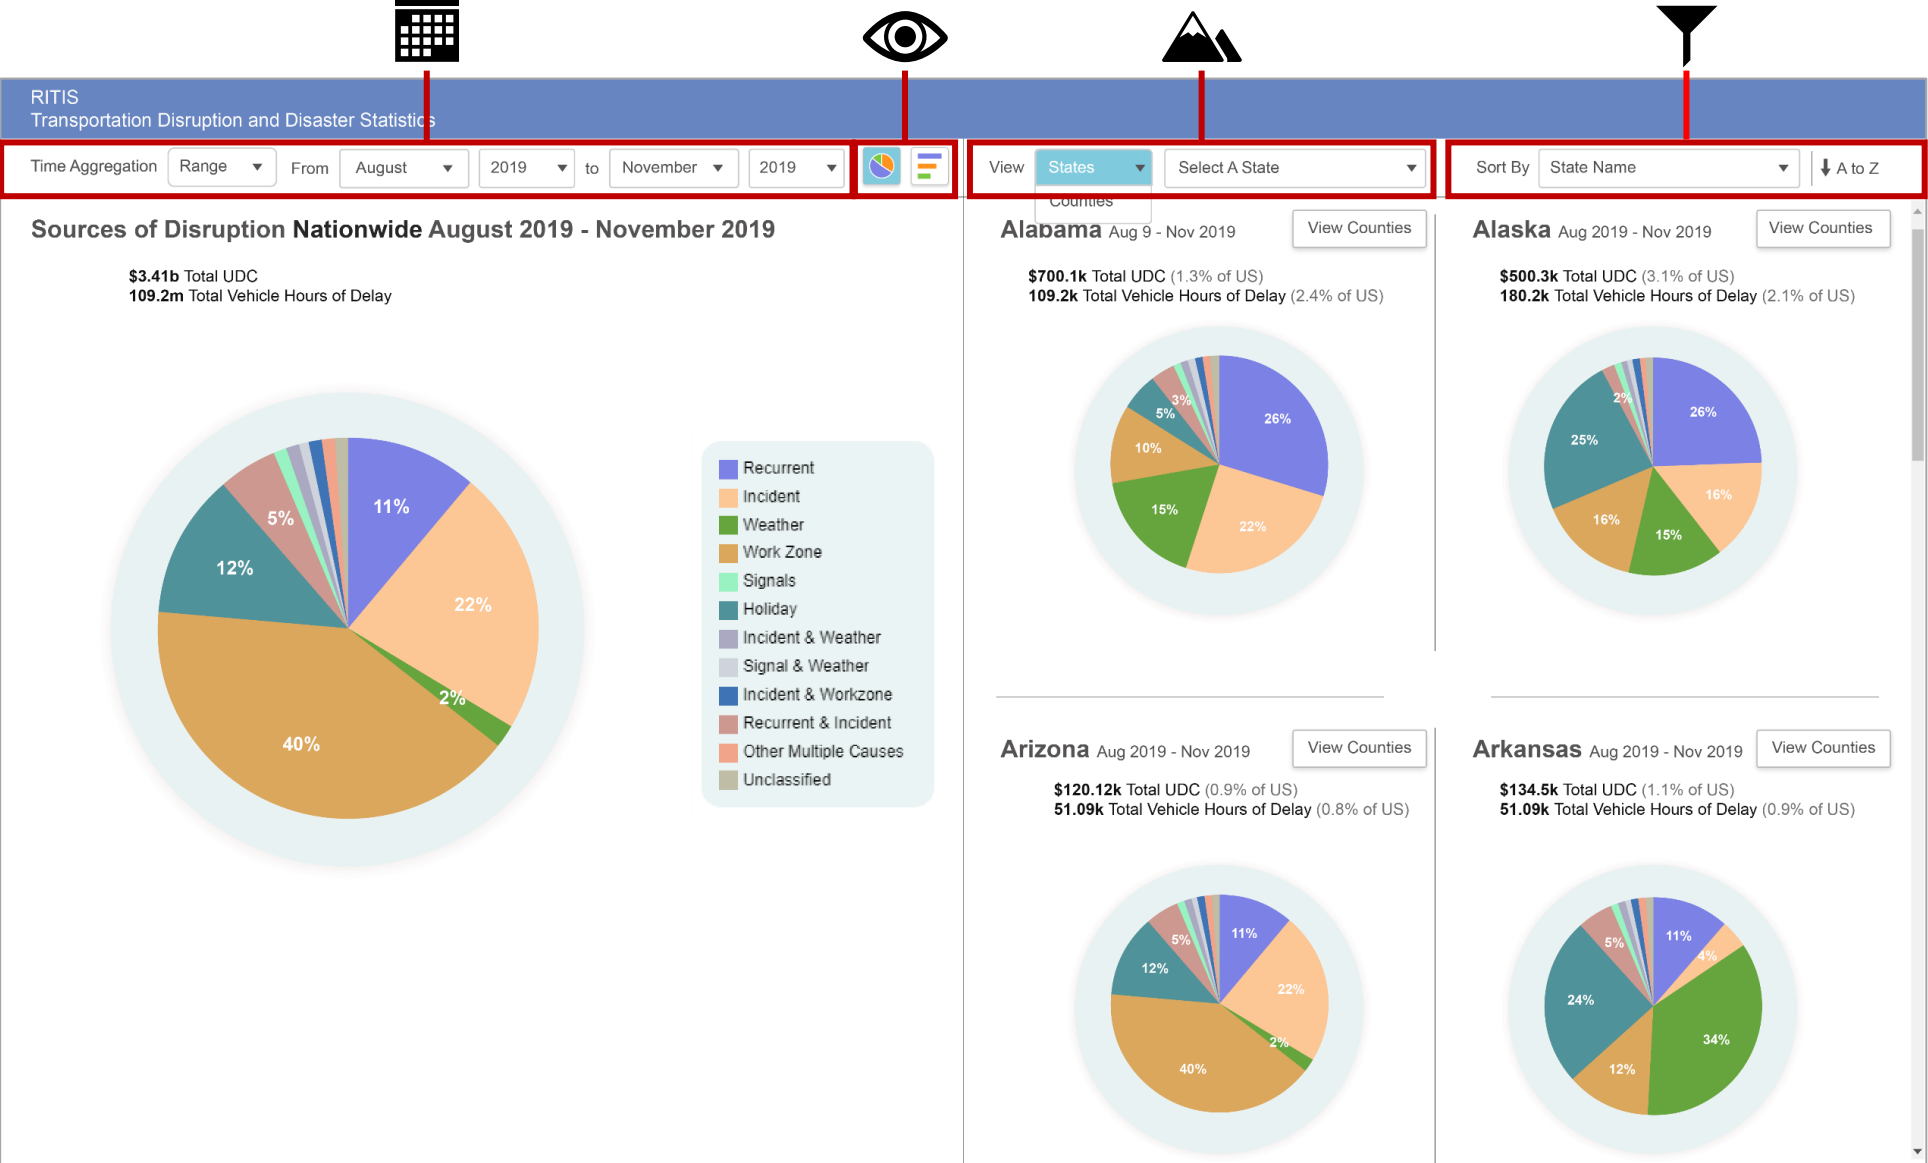

Enhanced UI layout & function

**Temporal Controls**

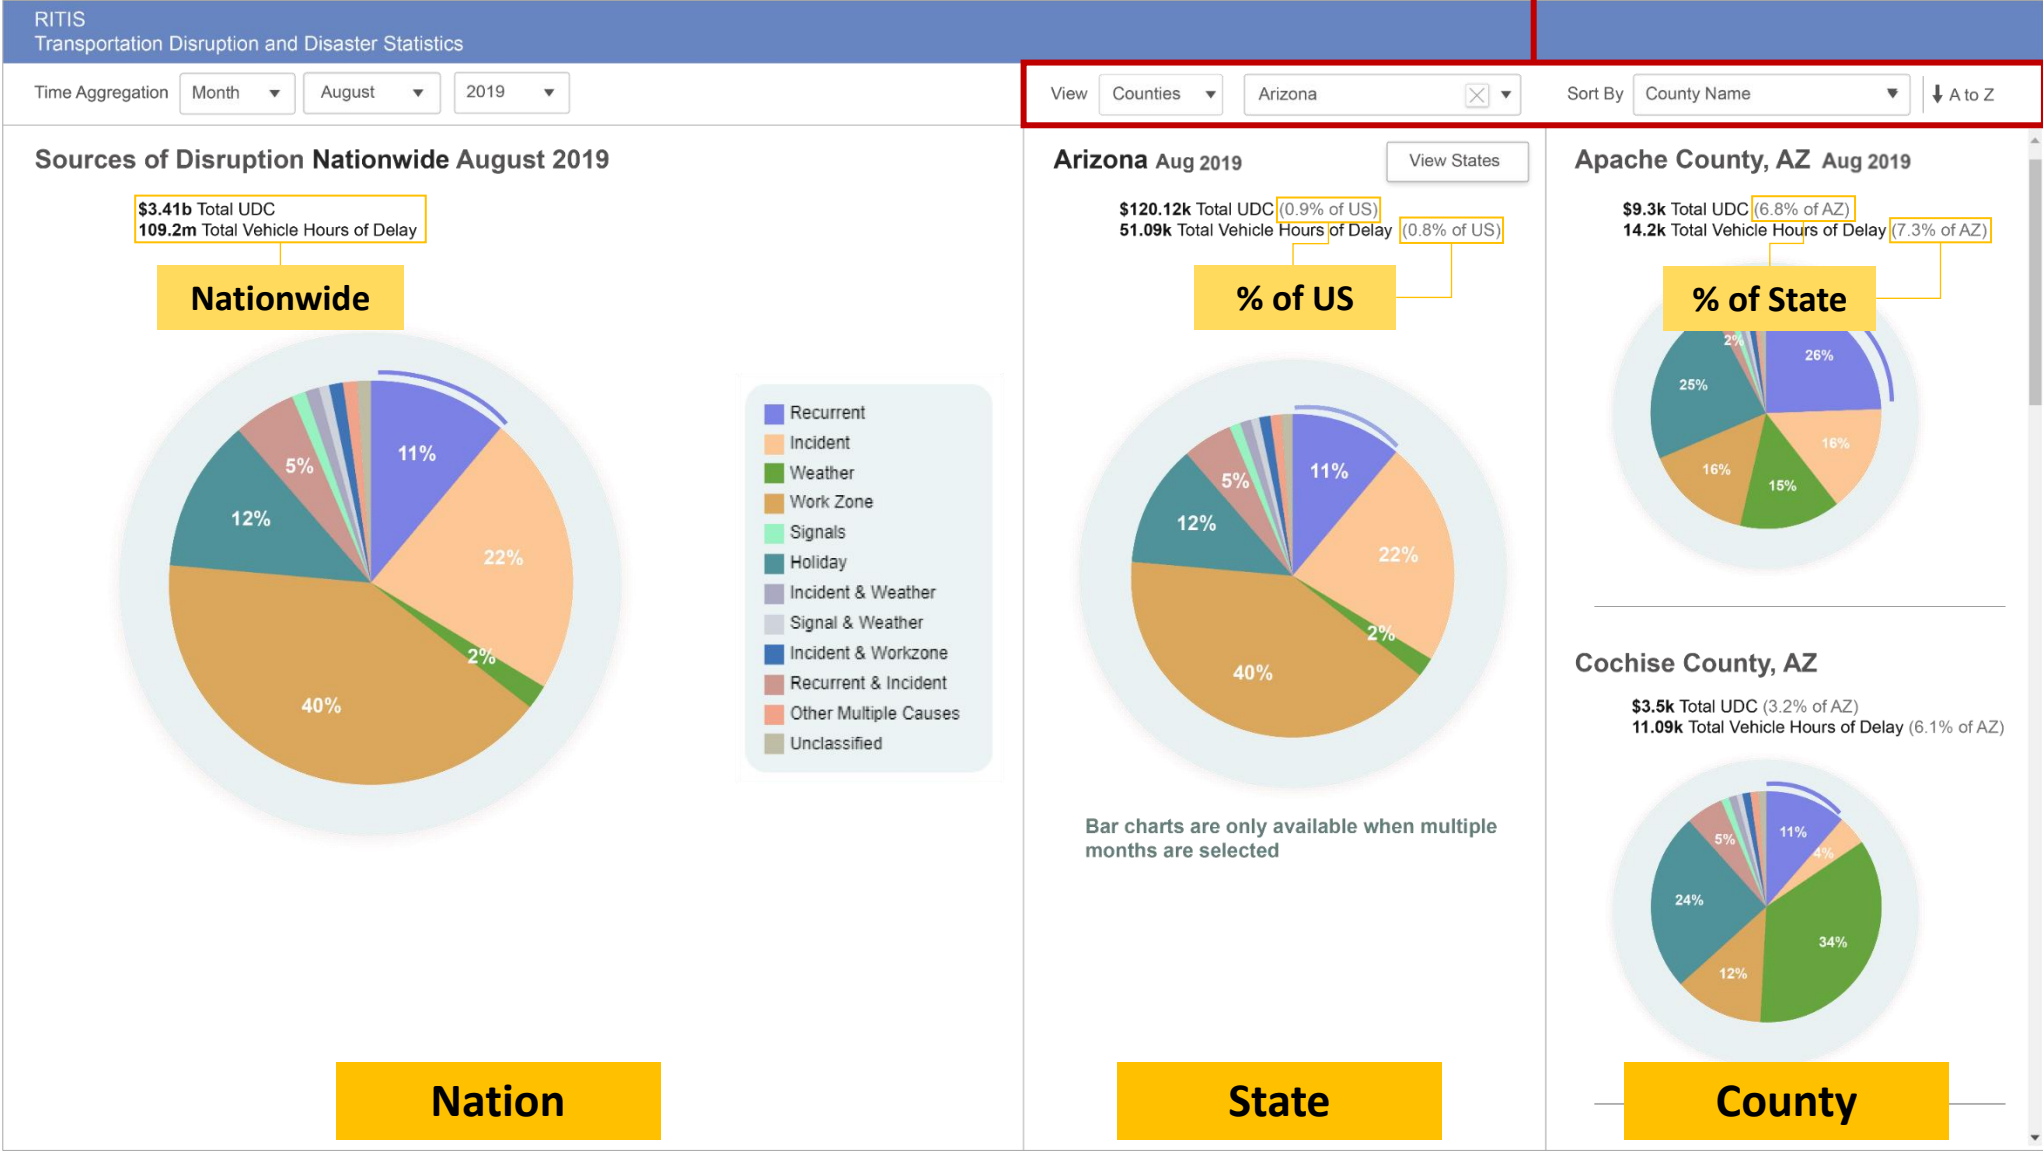

**Viz Style Controls**

**Geographic Controls**

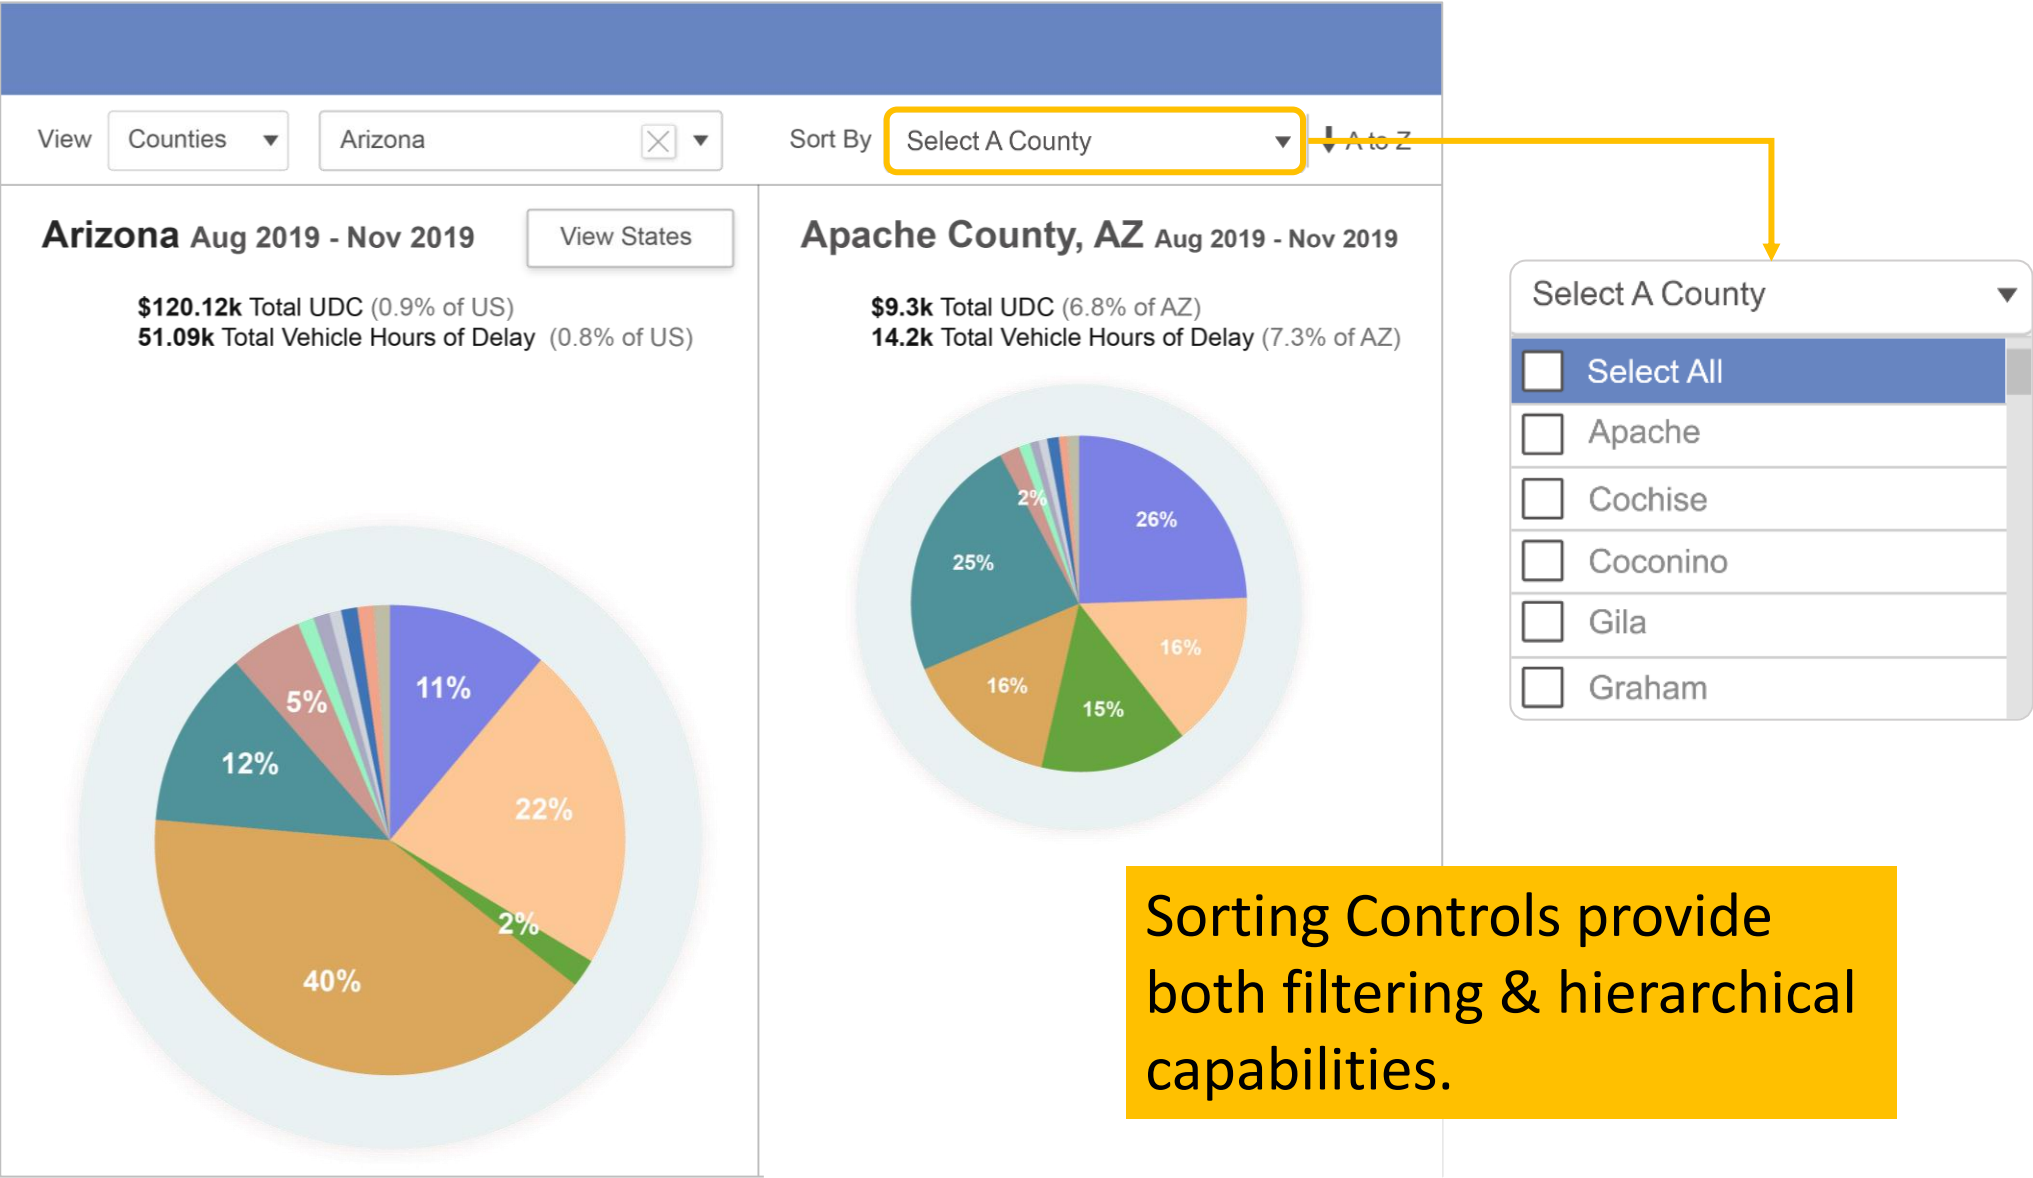

**Sorting Controls**

Geographic controls

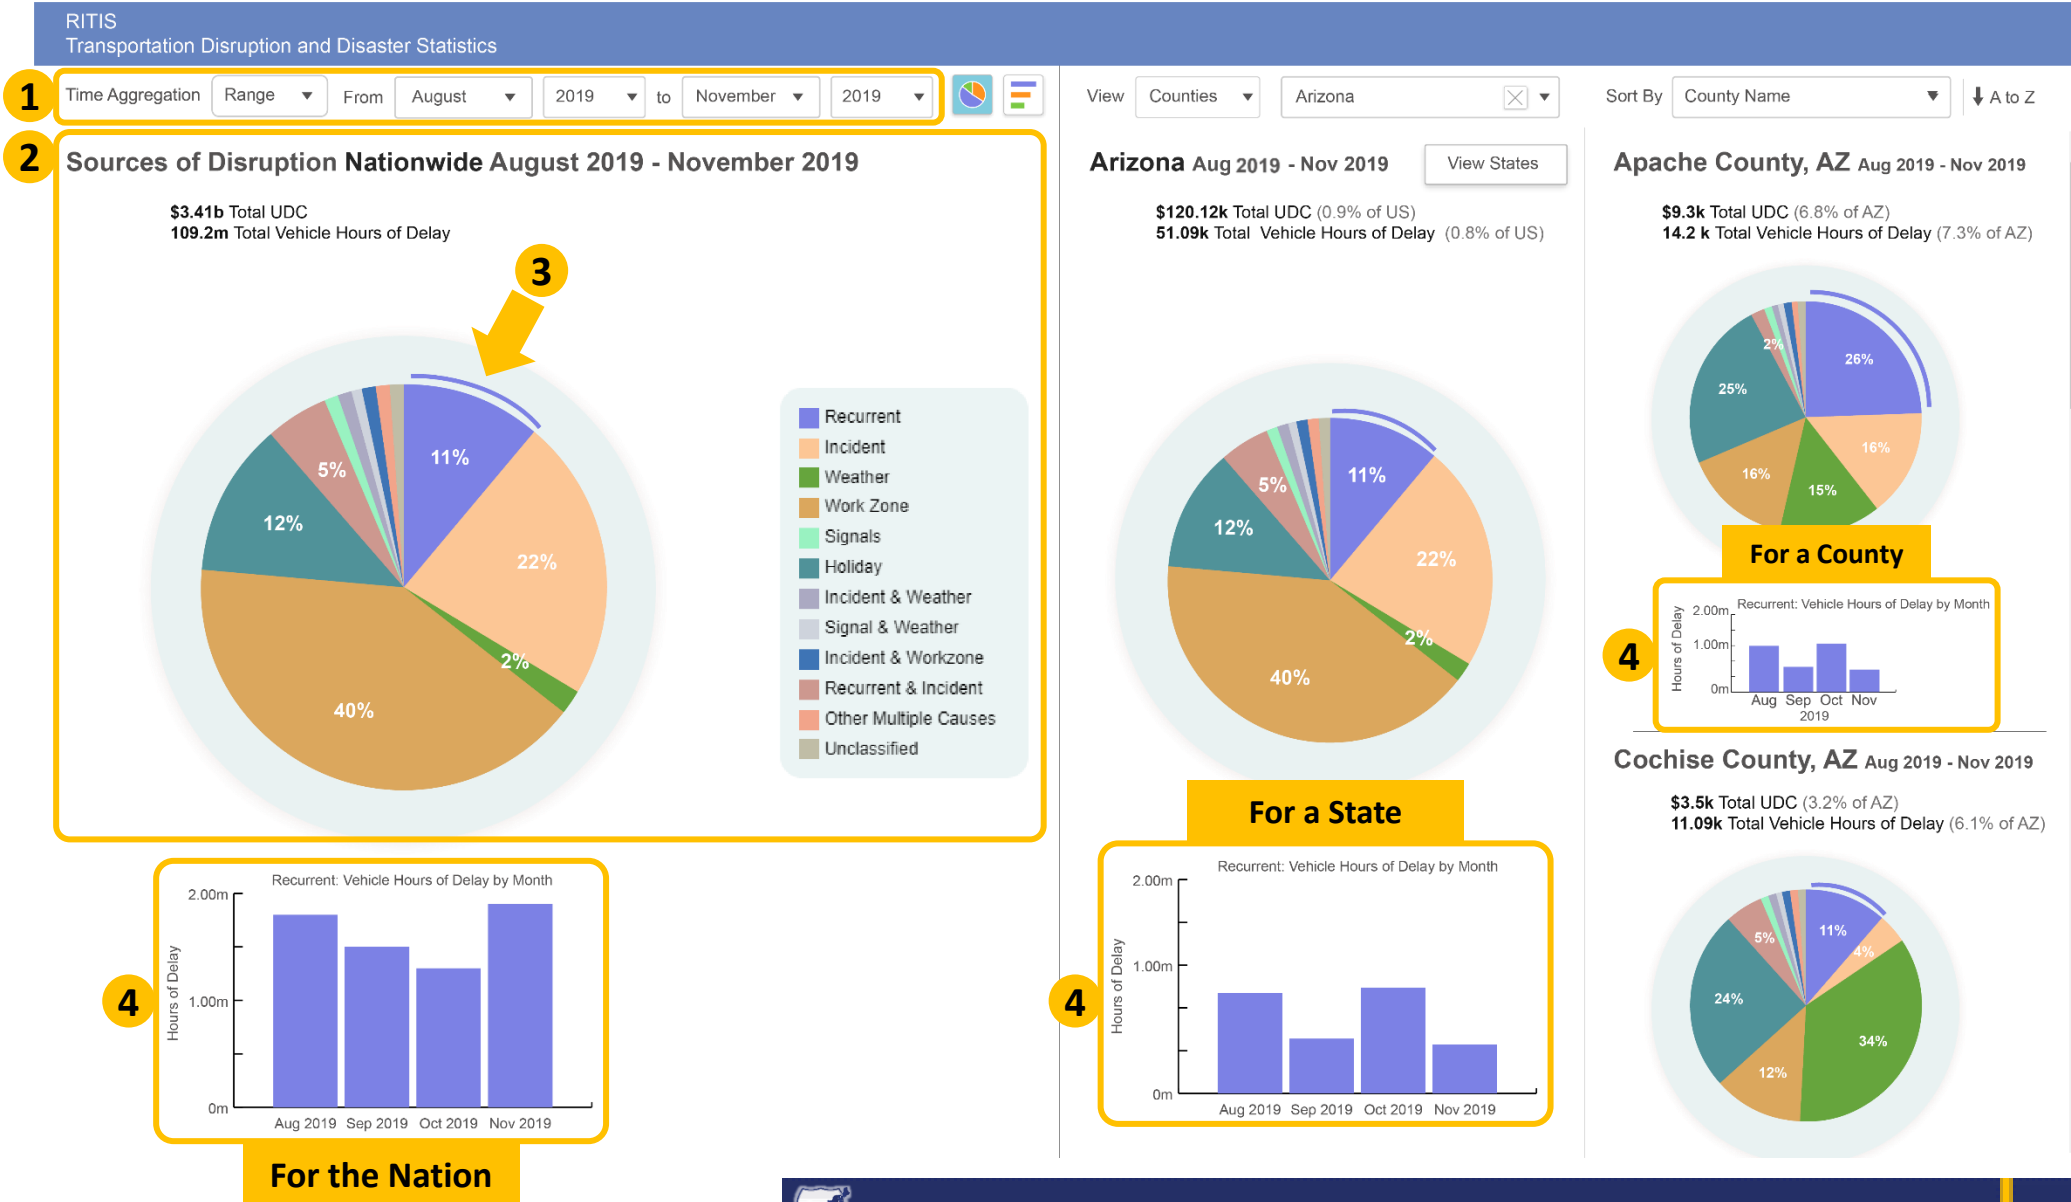

State -> County ordering

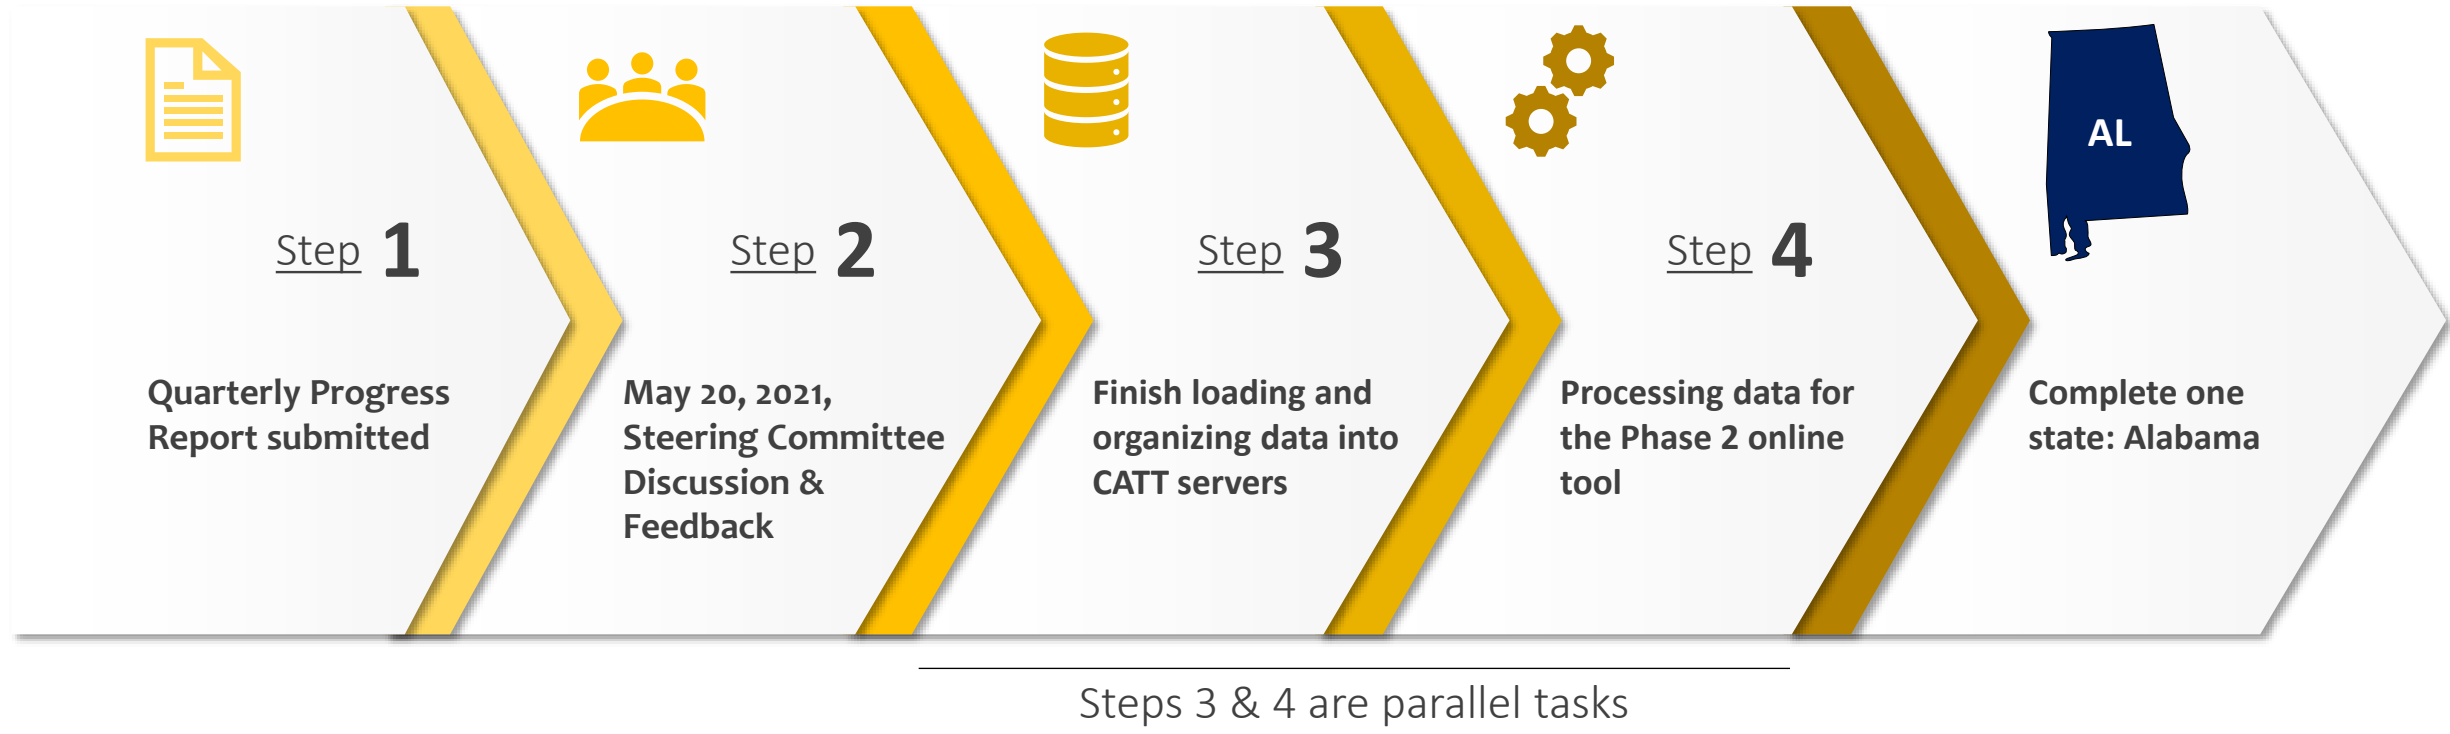

Month-by-Month comparisons

- 1 Select a date range
- 2 Results show sources of disruption for that range
- 3 Select a disruption type
- 4 A bar chart auto-generates for that source of disruption's date range

Next Steps through June 2021

Manager, Congestion Management Programs

COVID-19 Impacts on Travel Trends using the RITIS-PDA Suite: Using PM3 Travel Time Reliability, Congestion and Other Performance Measures

TETC - RITIS User Group Web Meeting | May 20, 2021

Thomas K. Edinger, AICP | tedinger@dvrpc.org | 215.238.2865

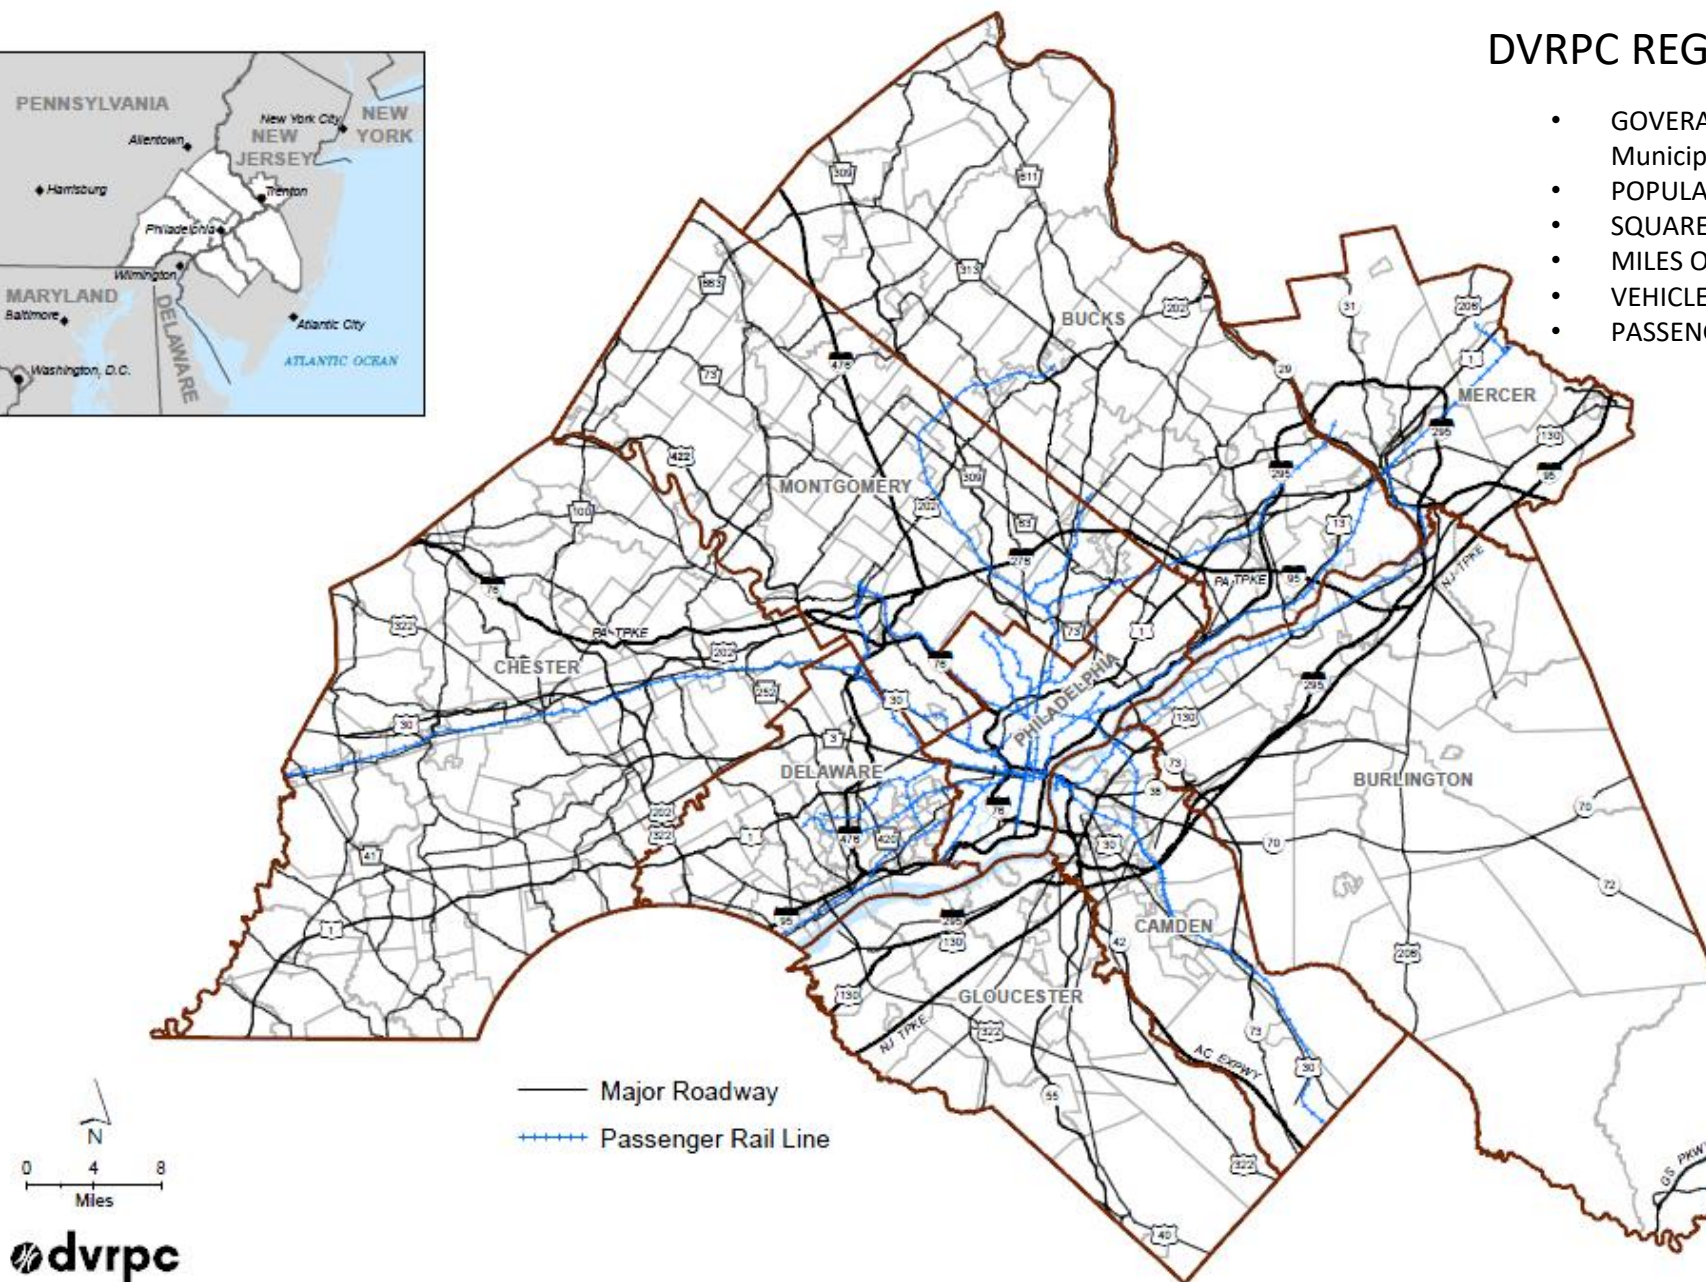

Delaware Valley Regional Planning Commission (DVRPC) Region

DVRPC REGION BY THE NUMBERS

- GOVERNANCE: **2 STATES, 9 COUNTIES, and 351 Municipalities**
- POPULATION ESTIMATE (2019): **5.75 million**
- SQUARE MILES: **3,833**
- MILES OF ROADWAY: **23,000**
- VEHICLE MILES TRAVELED EACH DAY: **110M**
- PASSENGER RAIL MILES: **356**

COVID-19 Impacts on Travel Trends

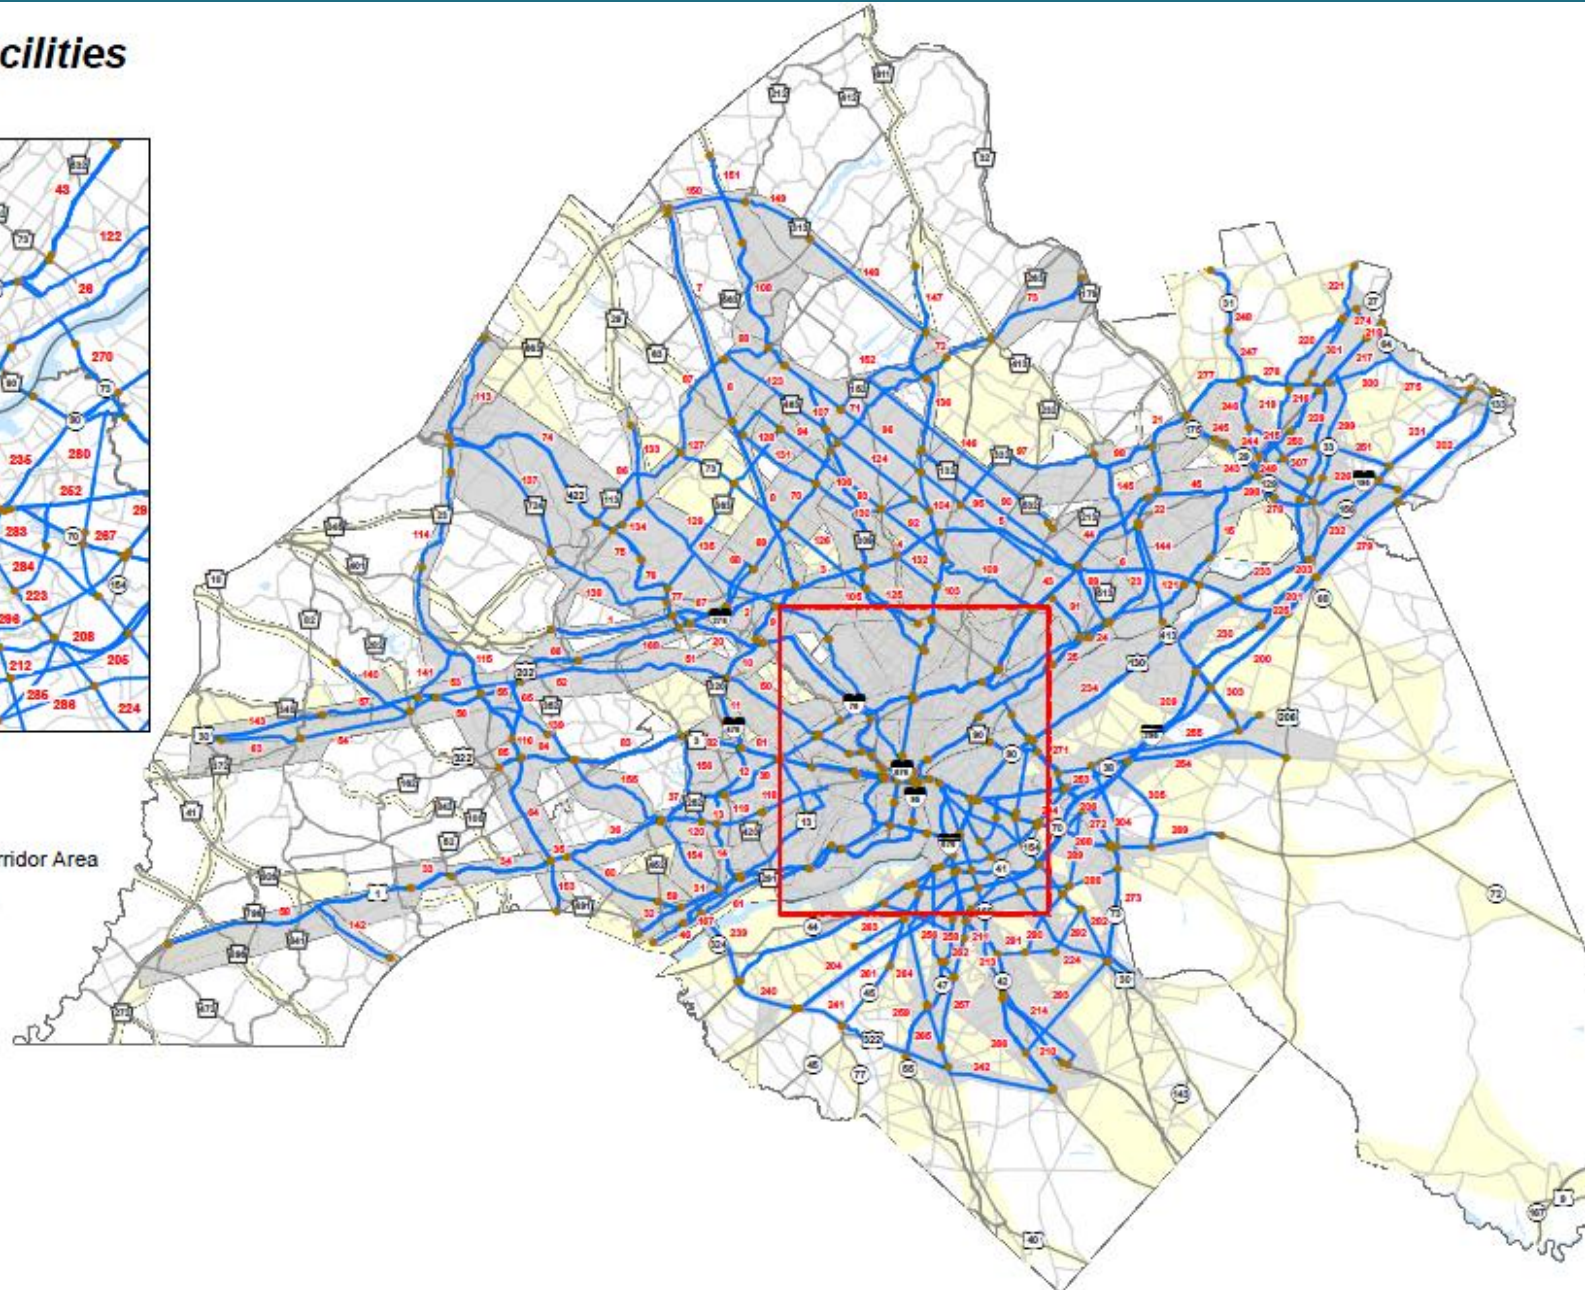

- **What do we mean by travel trends?**
- **Why evaluate COVID-19 impacts on travel trends?**
- **What are some considerations in evaluating trends?**
 - Evaluate corridor locations that are experiencing the most and the least changes in congestion and travel times
 - Evaluate other nearby multimodal transportation options that may be used or avoided in the future that may affect travel
 - Evaluate the time of day travel distributions
 - Evaluate which corridors are experiencing the most and least increases in speed

Congestion Management Process (CMP) Corridors

Focus Roadway Facilities

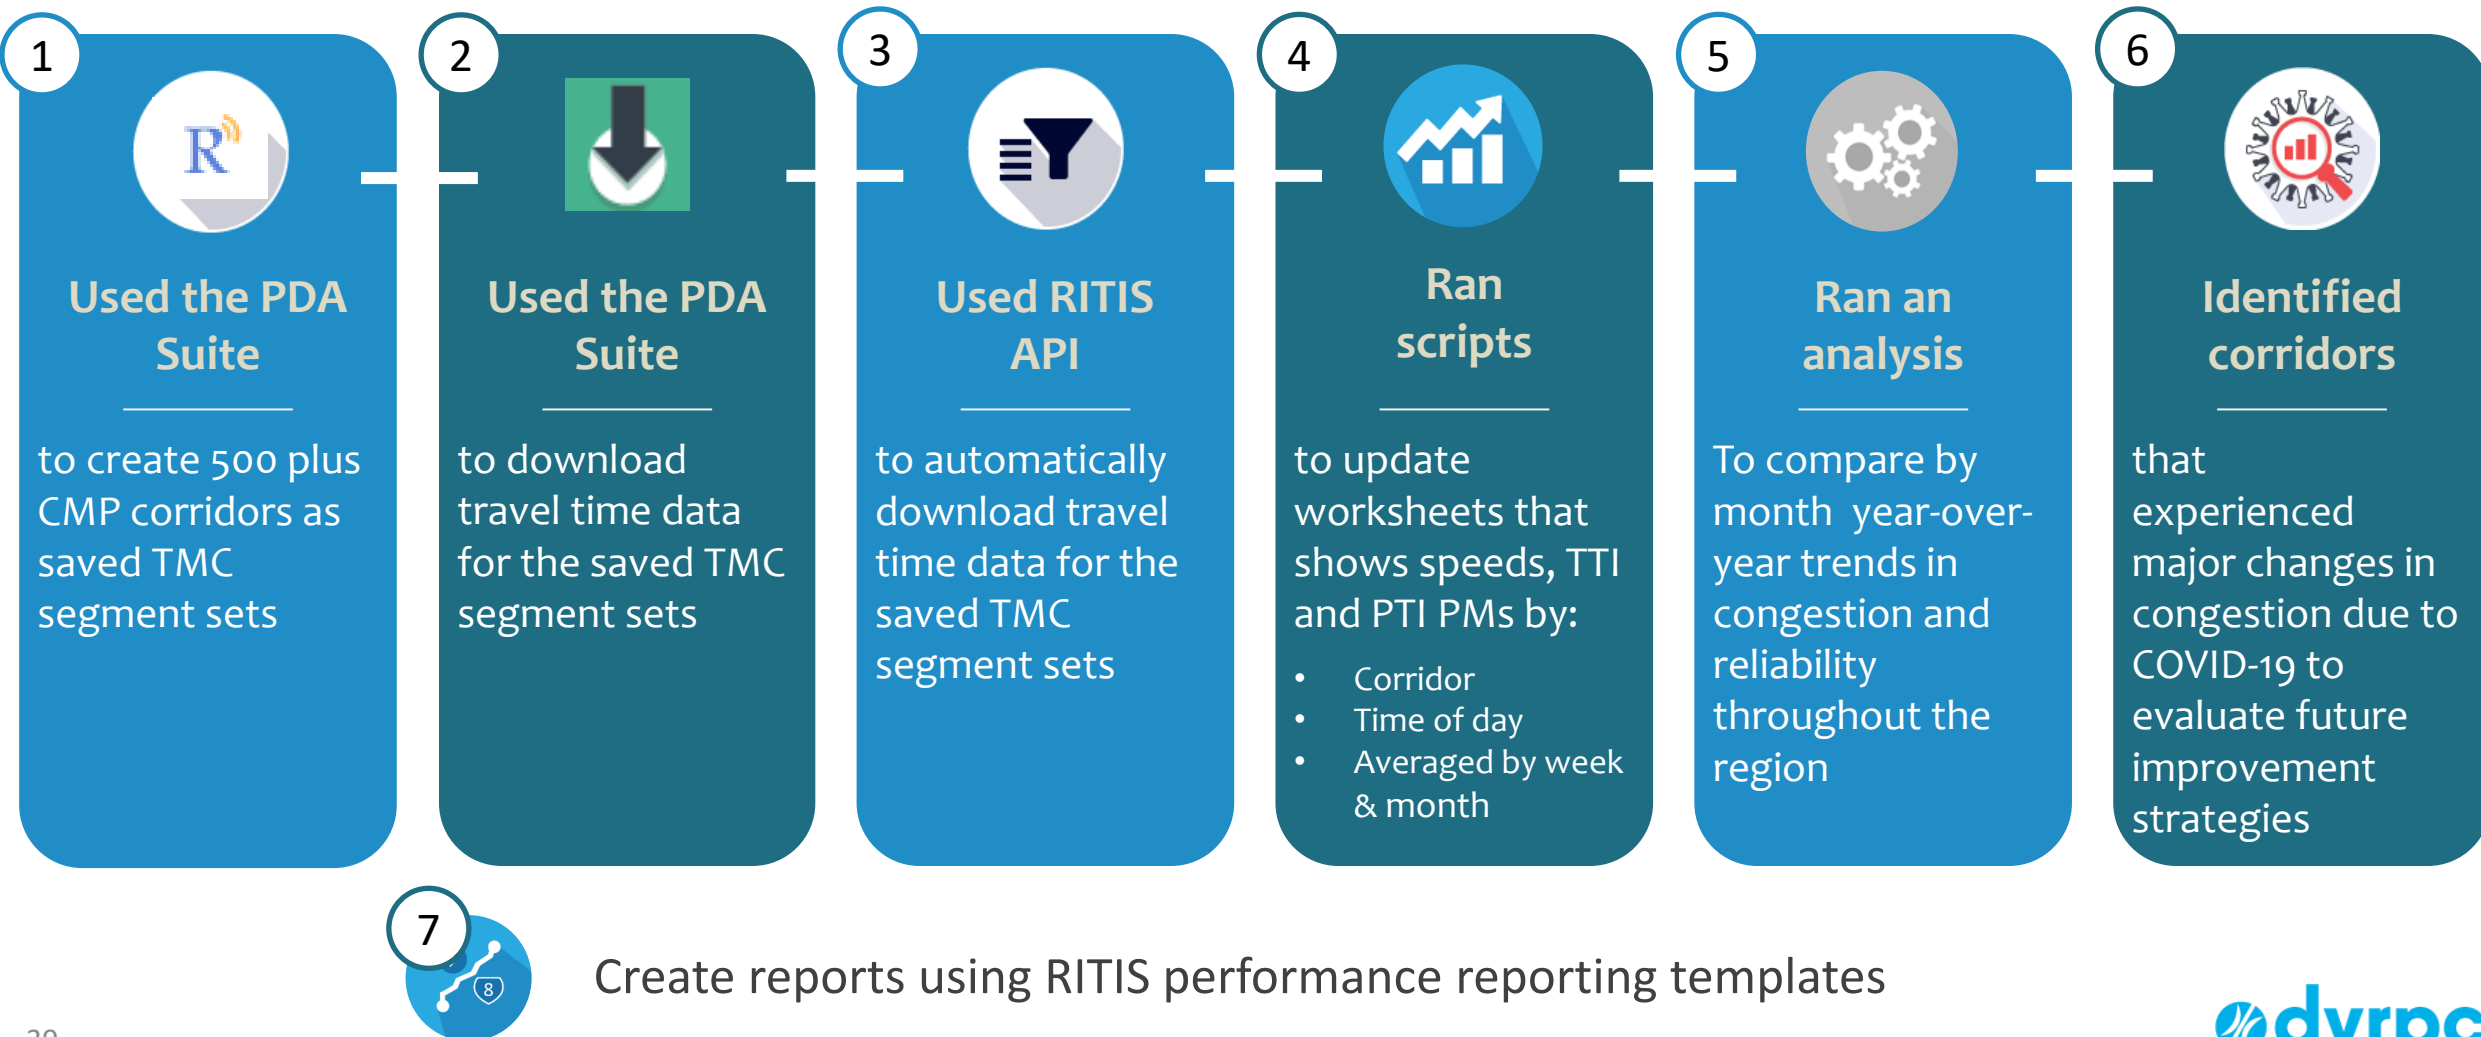

- 11 Focus Roadway Facility ID
- Focus Roadway Facility
- Congested Corridor and Subcorridor Area
- Emerging Growth Corridor Area

☒ 30
Real Time Data: Any segment that has adequate data, at any time of day, will report real time data.

☒ 20
Historic Average: Between 4 am and 10 pm, any segment without sufficient real time data will show the historical average for that segment during that day/time period (15 minute granularity).

☒ 10
Reference Speed: From 10 pm to 4 am, any segment without sufficient real time data will show the reference speed for that segment. Any segment that does not have calculated historical averages will show the reference speed 24 hours a day if there is not sufficient real time data.

SUBMIT

Your data request, "CMP-TMC-FID-019-I-76-from-US-1-City-Ave-to-I-476-EB", is now available for download.

You can access it here: <http://pda.ritis.org/export/download/be779972-8491-4b32-a347-c5034dff3041>

Submit Request

Job Submission Submitting an export, performance metrics, or user delay cost job.

POST /submit/export Export Job Submission

```
# Send the POST request
ritis_response = requests.post(submit_export_url, json = submit_export_json, verify = False)
print('Data payload was ', submit_export_json, '\n\n')
```

Get Job Status

Job Status Polling for the status of any job.

GET /jobs/status Job Status

```
# Generate RITIS URL for the jobs status GET request
job_status_url = "http://pda-api.ritis.org:8080/jobs/status?key=" + RITIS_API_KEY + "&jobId=" + ritis_response_jobID
# Send the GET request
job_status = requests.get(job_status_url)
```

Get Results

Job Result Retrieving the results of any job.

GET /results/export Export Job Results

```
# Generate RITIS URL for the export results GET request
results_export_url = "http://pda-api.ritis.org:8080/results/export?key=" + RITIS_API_KEY + "&uuid=" + curr_uuid
# Send the GET request
results_export = requests.get(results_export_url)
```

DVRPC CMP F
Travel Time Index S

The COVID-19 pandemic has altered congestion on many roadways due to reduced traffic. This study examines how congestion leads to reductions in air quality, the environment and commuters. The purpose of this study is to identify the most congested, and which ones are most helpful in scheduling and prioritizing projects in the region.

Archived GPS vehicle probe data from hour congestion using the Travel Time measure is defined as the ratio of the travel time). The higher the TTI is, the 2021 to 2020 as a result of the pandemic experience high congestion in February

The top ten CMP corridors that experienced the greatest decrease in congestion corridor and 5:00-6:00 PM peak hours. Tables 5 through 8 show congestion comparing February YOY for congested locations using the TTI measure comparing February year-over-year. A TTI including the absolute change and congested corridors and most absolute or percent change.

CMP corridors in the Pennsylvania portion of the New Jersey portion of the DVRPC region during the peak hours include (from west to east): I-76 (Schuylkill Expressway) from I-95 to I-76, I-76 from I-76 to I-476, and US 1 from US 30 (Girard Ave) to I-476. Corridors in the New Jersey portion of the DVRPC region include (from west to east): I-95 from NJ 29 to US 1 and CR 583 (Fleming Rd) from CR 561 to CR 534 and NJ 168 from NJ 168 to NJ 168.

CMP corridors that experienced the most significant increase in the Pennsylvania portion of the DVRIS are I-476 from US 30 to I-95 and I-76 from I-476 (Betsy Ross Bridge) to Frankford Avenue. The most significant decrease in Road in Chester County (See Tables 5.1

CMP corridors that experienced the g
DVRPC region include I-676 from I-76
and CR 686 (W Clementon) from CR 5:
County Line, CR 571 (Washington Rd)
the NJ Turnpike from Exit 5 (Burling
through 12).

CMP ID highlighted in blue indicates a corridor that is in both top ten lists for absolute and percent change in TTI for the 5:00-6:00 PM peak hour

This portion of I-76 between US 1 (City Ave and I-46), also known as the “Schuylkill Expressway”, is one of Philadelphia’s major northwest-southeast corridors connecting commuters from the northwestern Philadelphia suburbs to Center City.

Region of Study: I-76 between US 1 (City Ave) and I-476

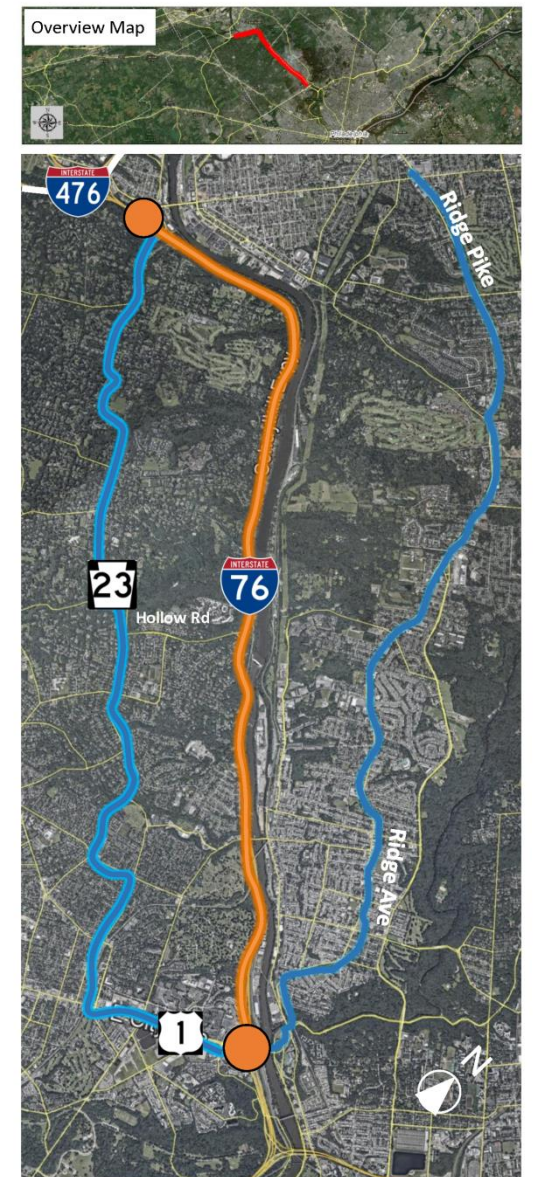

This portion of I-76, also known as the “Schuylkill Expressway”, is one of Philadelphia’s major northwest-southeast corridors connecting commuters from the northwestern Philadelphia suburbs to Center City. It is paralleled by PA Route 23 to the south and Ridge Pike and Ridge Avenue to the north.

This seven-mile section of the Schuylkill Expressway extends from US 1 to I-476 and is a limited access four-lane divided highway that contains a northbound off-ramp at Hollow Road (Exit 337) half-way between and a southbound and northbound on-and off-ramp, respectively, at Matsonford Road on the northwestern end.

The roadway carries about 130,000 vehicles a day, four times more than what it is built to handle. As a result the roadway has become known for frustrating delays.

Purpose of Study:

This annual study examines the yearly performance of this critical corridor in terms of travel time and congestion variations and compares it to prior years back to 2017.

A PDA Suite Performance Chart Tool

- Westbound AM Peak average travel times are greater than eastbound at 9.09 and 8.92, respectively

B PDA Suite Congestion Scan Tool

- Most congestion is during the eastbound PM Peak between Mastsonford Road and Hollow Road

C PDA Suite Performance Summaries Tool

- Steep declines in travel times eastbound PM Peak

D PDA Suite Performance Summaries Tool

- 80% decrease in travel times compared to Jan baseline; only 40% of baseline at year end

E PDA Suite Performance Summaries Tool

- 40% decrease in travel times; back to baseline at year end

2020 Corridor Travel Times and Congestion

Weekday travel times for this portion of the I-76 corridor were aggregated over the entire year. During the PM peak period, the eastbound direction indicates a higher peak average travel time compared to the westbound direction, or about 2.5 minutes longer. In the eastbound direction, the PM peak travel times and planning times are consistently higher than the AM times. The average PM peak travel time is about 3.5 minutes longer than the AM period travel time, and the planning time is approximately 9 minutes longer. This is due in part to expanded job opportunities in the King of Prussia and Conshohocken areas farther west and City residents commuting back home from work. The heat map at the bottom of the page shows the geographic location of typical congestion through the day.

Locations of Typical Slow Downs (EB)

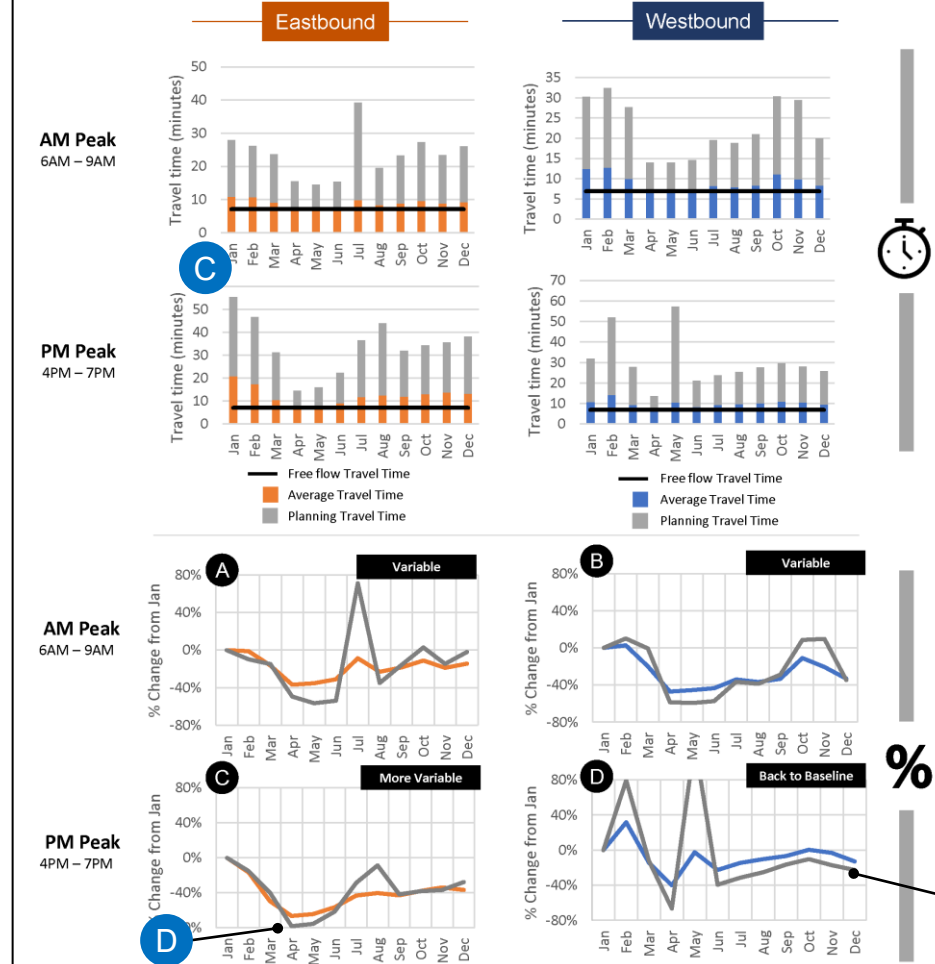

- A: 3 PM - 6 PM : Matsonford Rd to Hollow Rd
B: 4 PM - 5 PM : Hollow Rd to Belmont Ave

Locations of Typical Slow Downs (WB)

- C: 6 AM - 8 AM : US 1 to Belmont Ave
D: 1 PM - 5 PM : US 1 to Belmont Ave
E: 1 PM - 3 PM : Belmont Ave to Hollow Rd
F: 2 PM - 5 PM : Hollow Rd to Matsonford Rd

2020 Changes in Travel Times

How did travel times change over the course of 2020? This depends on time of day and direction of travel. The bar charts show monthly travel times by peak period and direction. The line charts show the percentage change in travel times and planning times as compared to a January 2020 baseline. The percent change in travel times has not exceeded the January baseline since February as a result of the pandemic.

Observations

① In the eastbound AM peak period, travel times decreased from Feb to Apr and then gradually increased through the analysis period. ② In the westbound AM peak, there was a sharp decline in travel time from Feb to Apr and then gradually increased through Oct, but then declined through Dec. ③ Travel times in the eastbound direction during the PM peak declined sharply from Jan to Apr (60%), and then gradually increased through Dec. ④ Travel times in the westbound direction during the PM peak declined from Feb to Apr, and then remained relatively flat through the end of the year, while approaching baseline conditions.

A PDA Suite Performance Summary Tool

- Eastbound AM peak consistent travel times (2017-2019), but declined in 2020

B PDA Suite Performance Summary Tool

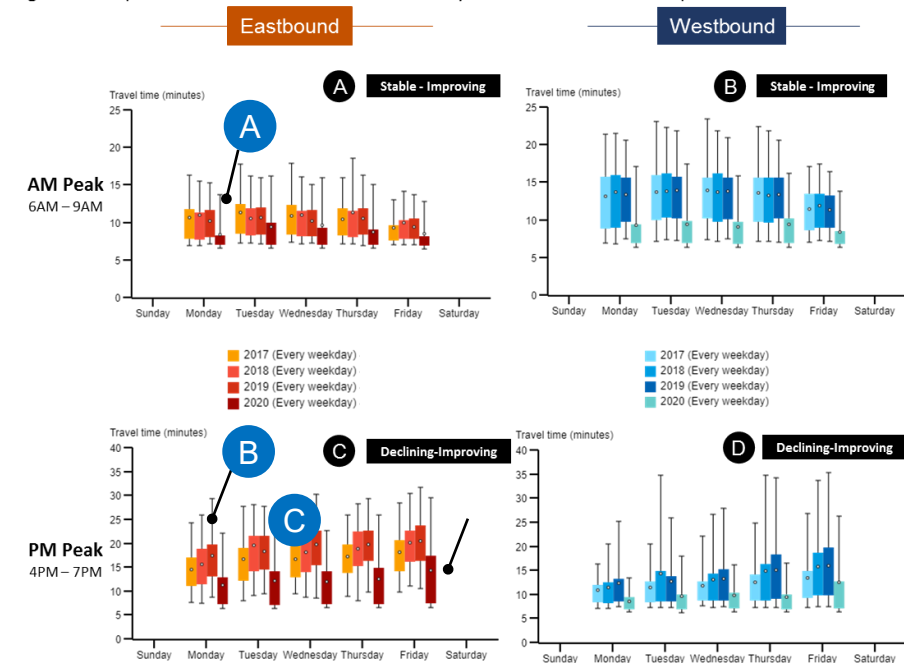

- Eastbound PM peak Increasing travel times (2017-2019), but declined in 2020

C PDA Suite Performance Summary Tool

- Eastbound PM Peak Friday travel most congested

Comparison with previous years

How much did travel times change compared to previous years? In the AM and PM peak periods, average travel times and travel time reliability were fairly constant from 2017 to 2019. However, there were significant improvements in travel times and reliability in 2020 as a result of the pandemic.

Ⓐ During the AM peak period in the eastbound direction, travel times and reliability remained relatively constant from 2017 to 2019 but improved significantly in 2020. Ⓑ The same is true for the westbound direction, but the travel times were higher and less reliable. Ⓒ During the PM peak period in the eastbound direction travel times progressively increased and reliability decreased from 2017 to 2019, but improved significantly in 2020. Ⓓ The same holds true for the westbound direction with the exception of lower travel times and in some instances more variability in travel.

The box plot presents a simplified distribution of the range of travel times throughout the period of interest, based on percentiles.

PDA Suite Map-21 Widget and Analyzing PM3 Measures

PM3 Measures:

- **Travel Time Reliability**
 - Interstate
 - Non-interstate
- **Truck Travel Time Reliability**
- **Peak Hour Excessive Delay**

Pennsylvania — Percent Travel Time Reliability for Non-Interstates

- A** Chester County had the highest reliability in 2020 at 97%
- B** Philadelphia had the lowest reliability in 2020 at 83%
- C** 2020 Statewide reliability of 94% well above 4-year target of 87.4%

Pennsylvania — Miles of Non-Interstate Not Reliable by County

- A** Philadelphia had the most miles (85) of unreliable non-interstate roads in 2020
- B** Montgomery County experienced the most improvement in reliability with a 60% change decrease YOY

2019 Travel Time Reliability for Non-Interstates by Road Segment

2019 - Level of Travel Time Reliability (LOTTR) Non-Interstate Roadways

LOTTR 2019

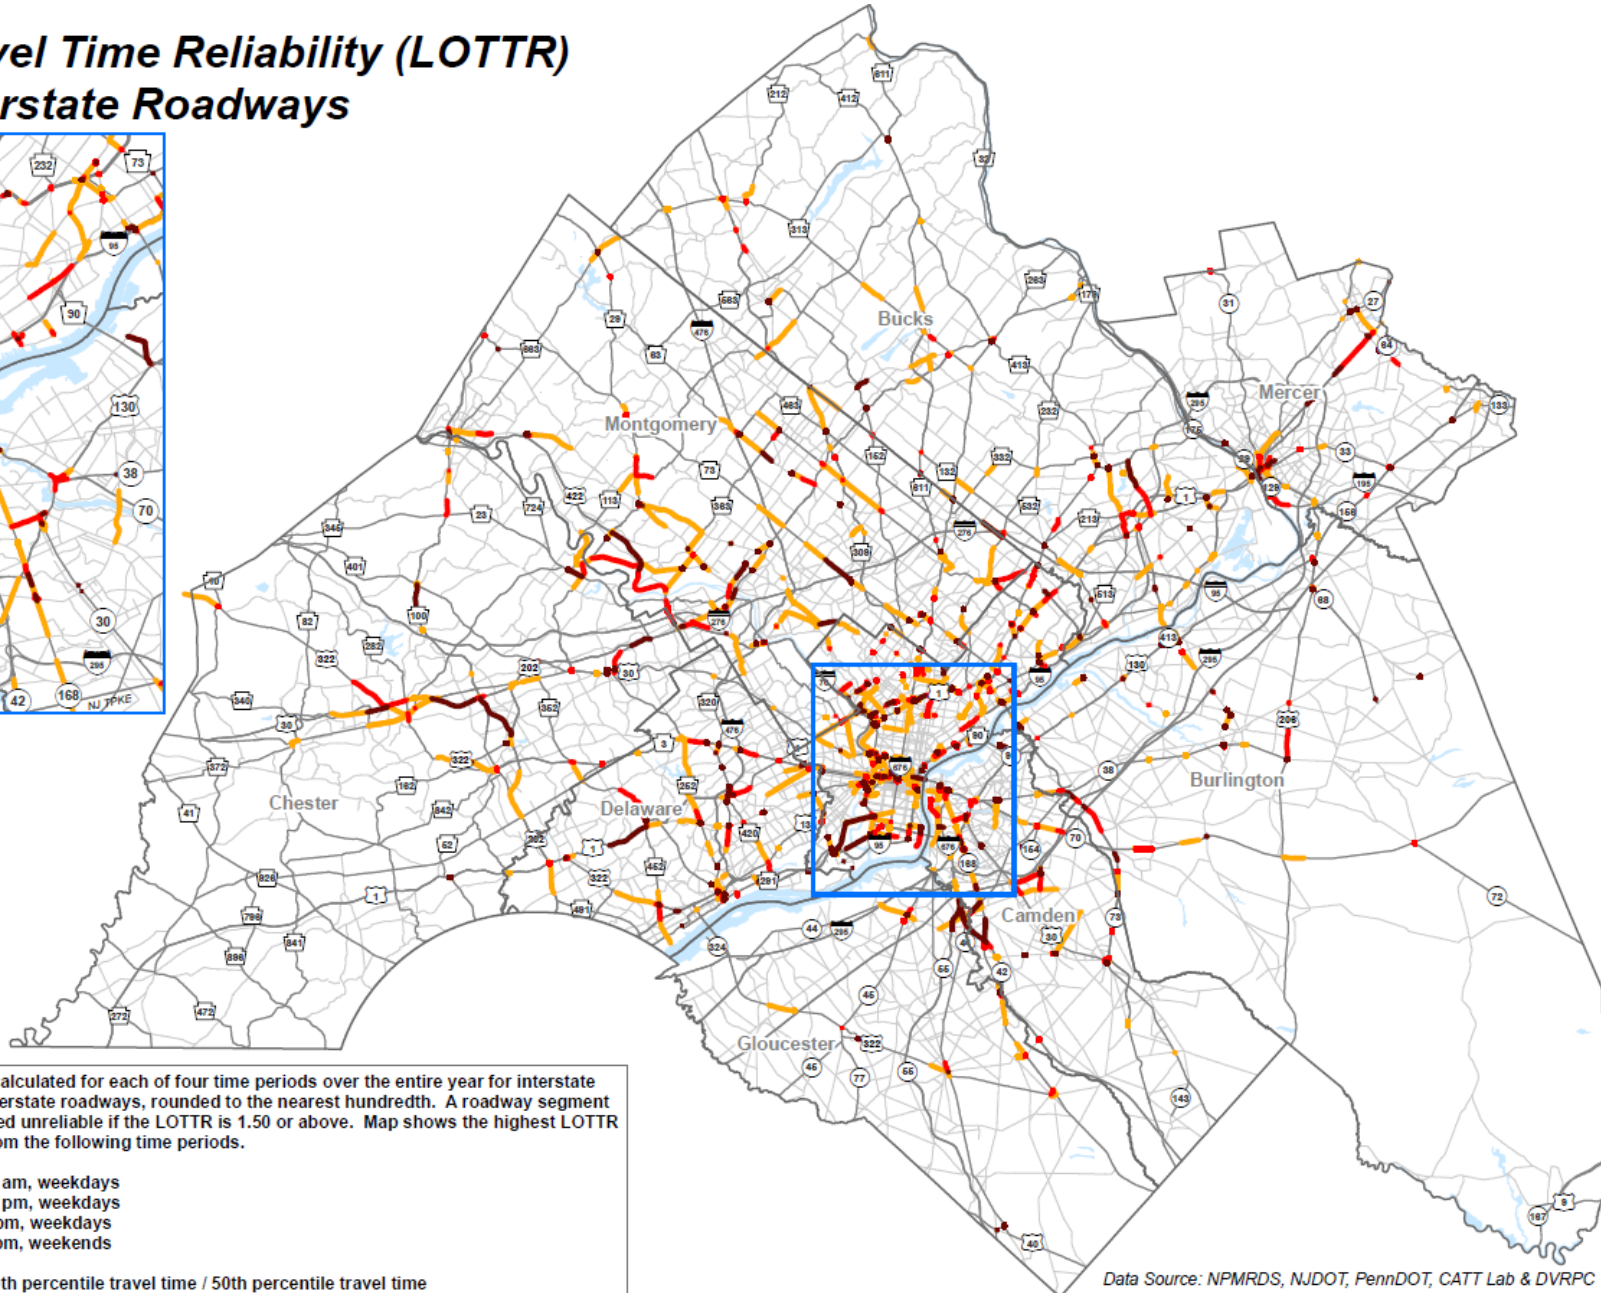

- Greater Than 2.00 (372)
- 1.75 - 2.00 (450)
- 1.50 - 1.74 (923)

LOTTR is calculated for each of four time periods over the entire year for interstate and non-interstate roadways, rounded to the nearest hundredth. A roadway segment is considered unreliable if the LOTTR is 1.50 or above. Map shows the highest LOTTR measure from the following time periods.

1. 6 am - 10 am, weekdays
2. 10 am - 4 pm, weekdays
3. 4 pm - 8 pm, weekdays
4. 6 am - 8 pm, weekends

LOTTR = 80th percentile travel time / 50th percentile travel time

2020 Travel Time Reliability for Non-Interstates by Road Segment

2020 - Level of Travel Time Reliability (LOTTR) Non-Interstate Roadways

LOTTR 2020

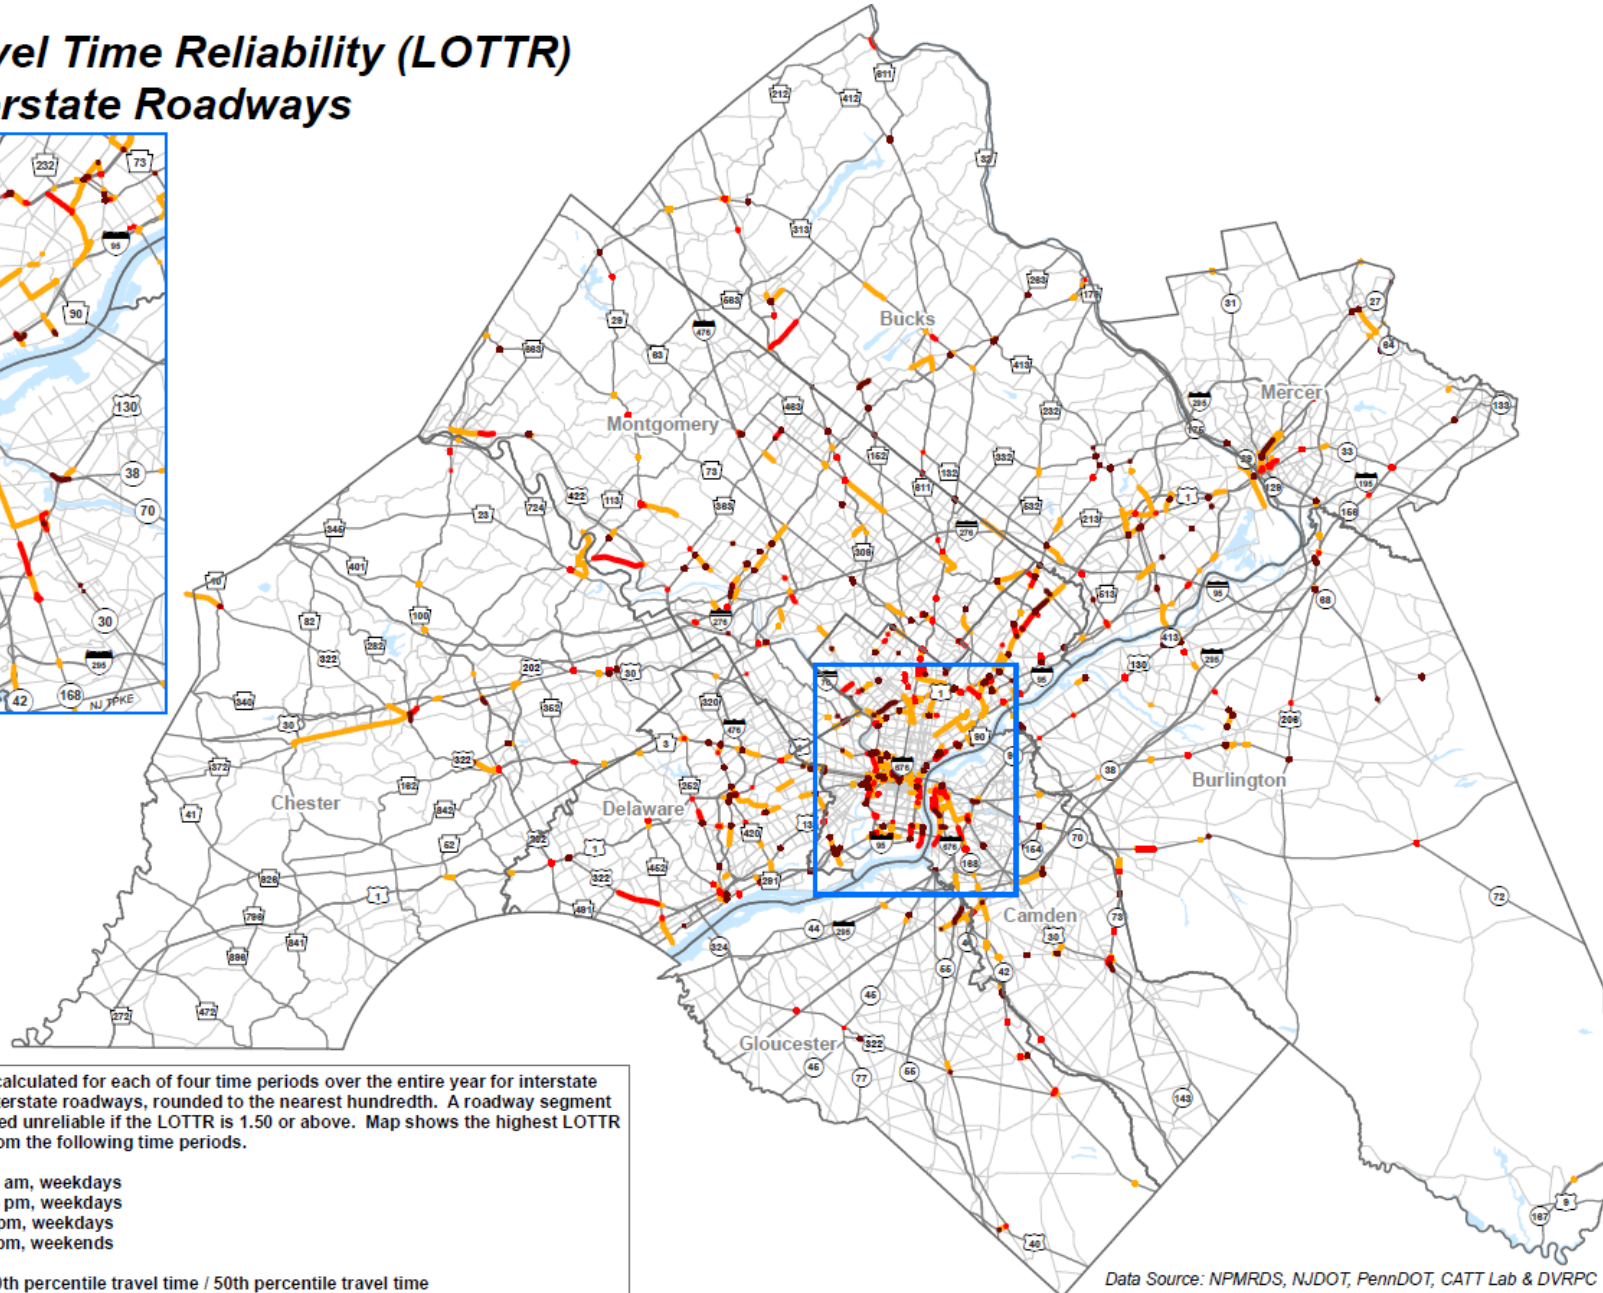

- Greater Than 2.00 (337)
- 1.75 - 2.00 (401)
- 1.50 - 1.74 (801)

LOTTR is calculated for each of four time periods over the entire year for interstate and non-interstate roadways, rounded to the nearest hundredth. A roadway segment is considered unreliable if the LOTTR is 1.50 or above. Map shows the highest LOTTR measure from the following time periods.

- 6 am - 10 am, weekdays
- 10 am - 4 pm, weekdays
- 4 pm - 8 pm, weekdays
- 6 am - 8 pm, weekends

LOTTR = 80th percentile travel time / 50th percentile travel time

Not Reliable in 2019 and 2020 on Non-Interstates by Road Segment

LOTTR Not Reliable in 2019 and 2020 Non-Interstate Roadways

LOTTR 2020

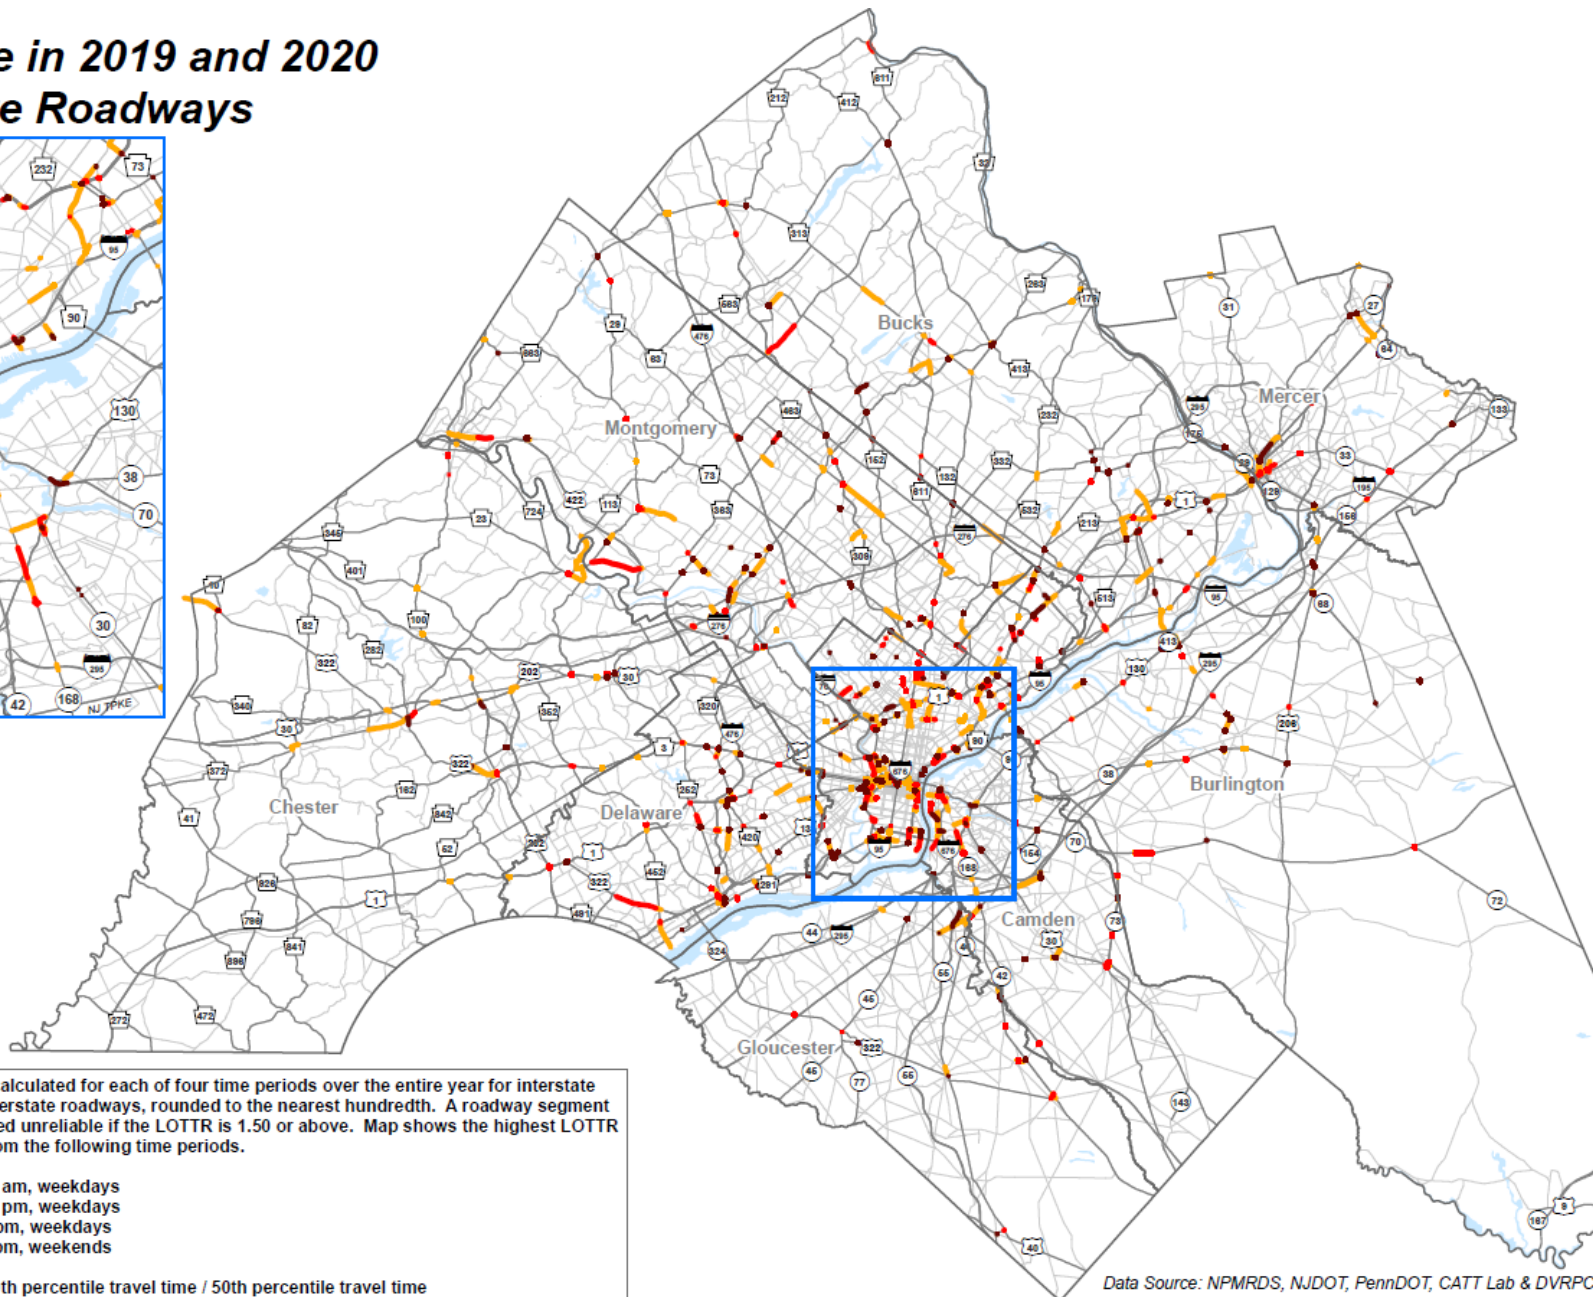

- Greater Than 2.00 (309)
- 1.75 - 2.00 (359)
- 1.50 - 1.74 (598)

LOTTR is calculated for each of four time periods over the entire year for interstate and non-interstate roadways, rounded to the nearest hundredth. A roadway segment is considered unreliable if the LOTTR is 1.50 or above. Map shows the highest LOTTR measure from the following time periods.

- 6 am - 10 am, weekdays
- 10 am - 4 pm, weekdays
- 4 pm - 8 pm, weekdays
- 6 am - 8 pm, weekends

LOTTR = 80th percentile travel time / 50th percentile travel time

Change in Reliability YOY on Non-Interstates by Road Segment

LOTTR Delta 2020 minus 2019 Non-Interstate Roadways

LOTTR 2020 minus 2019

- ≤ 0.00 (3,443)
- 0.01 - 0.50 (1,946)
- 0.51 - 2.00 (248)
- > 2.00 (24)

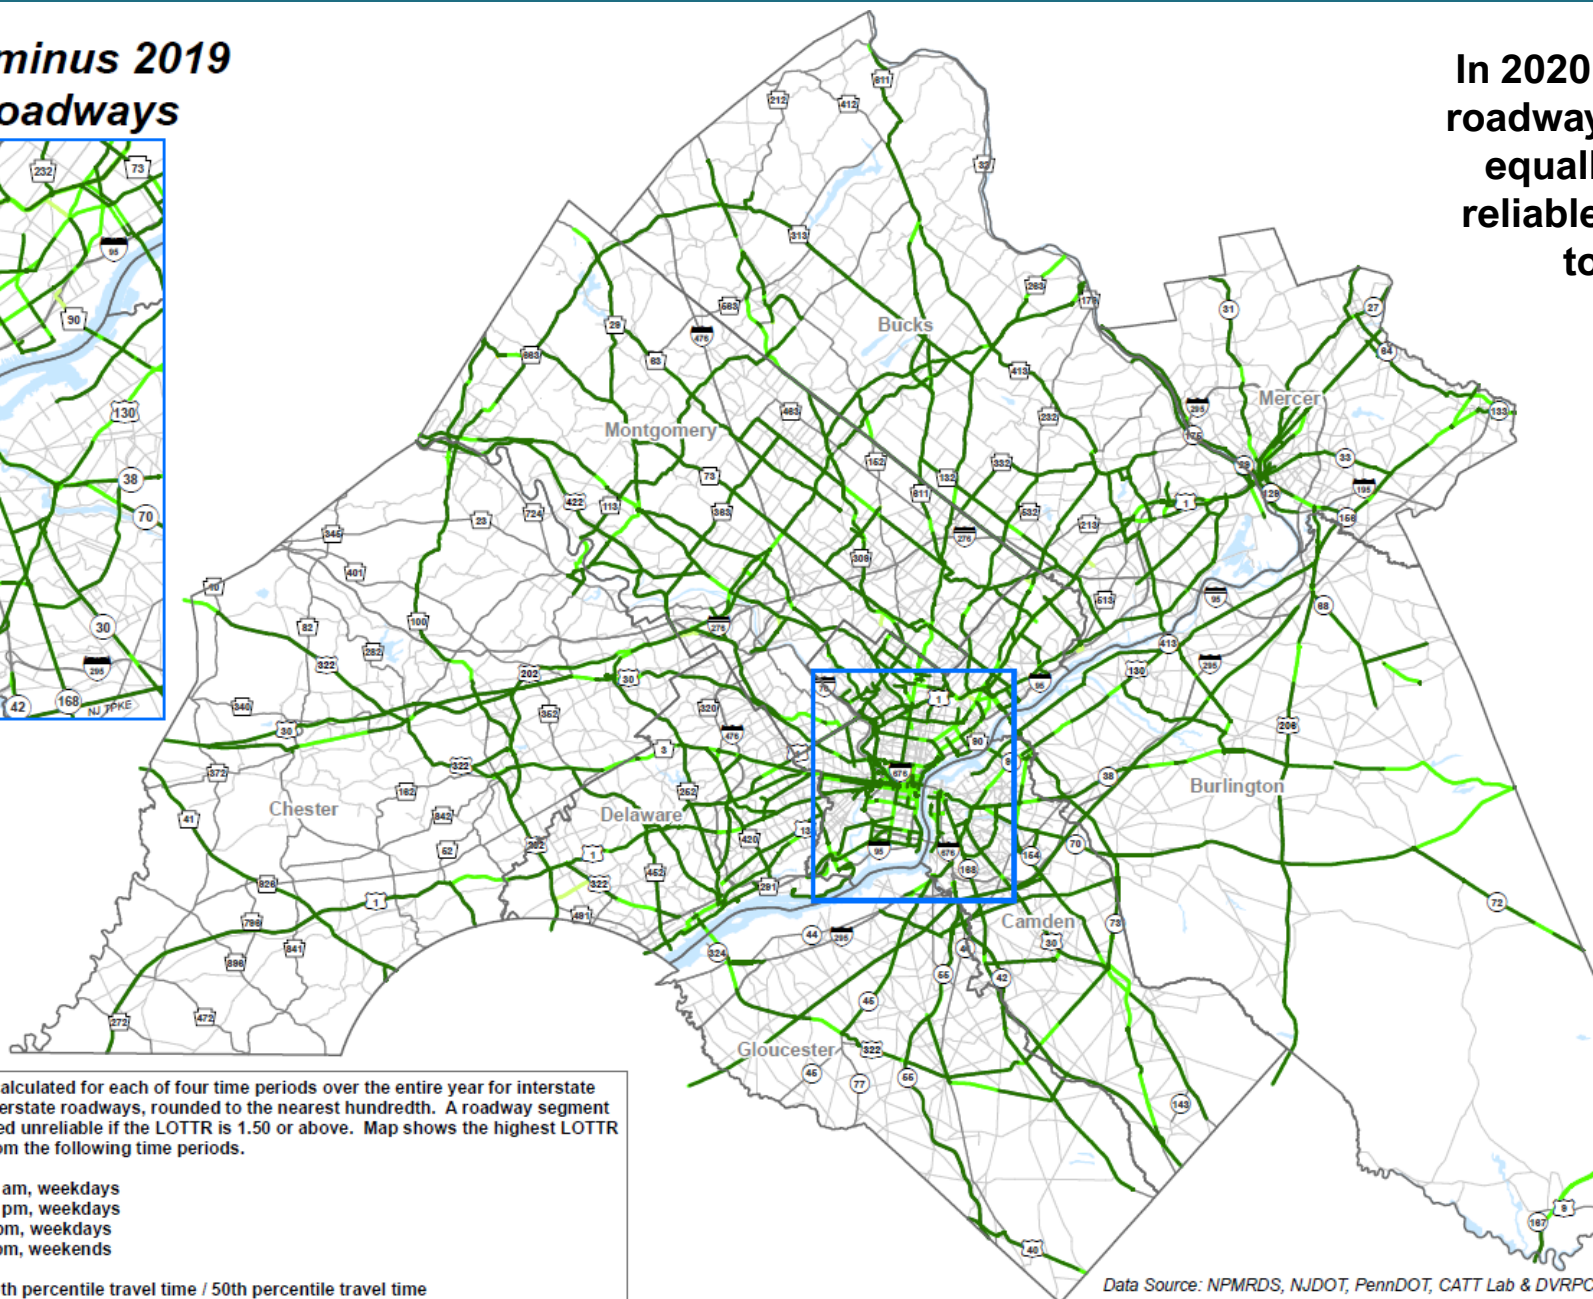

LOTTR is calculated for each of four time periods over the entire year for interstate and non-interstate roadways, rounded to the nearest hundredth. A roadway segment is considered unreliable if the LOTTR is 1.50 or above. Map shows the highest LOTTR measure from the following time periods.

1. 6 am - 10 am, weekdays
2. 10 am - 4 pm, weekdays
3. 4 pm - 8 pm, weekdays
4. 6 am - 8 pm, weekends

LOTTR = 80th percentile travel time / 50th percentile travel time

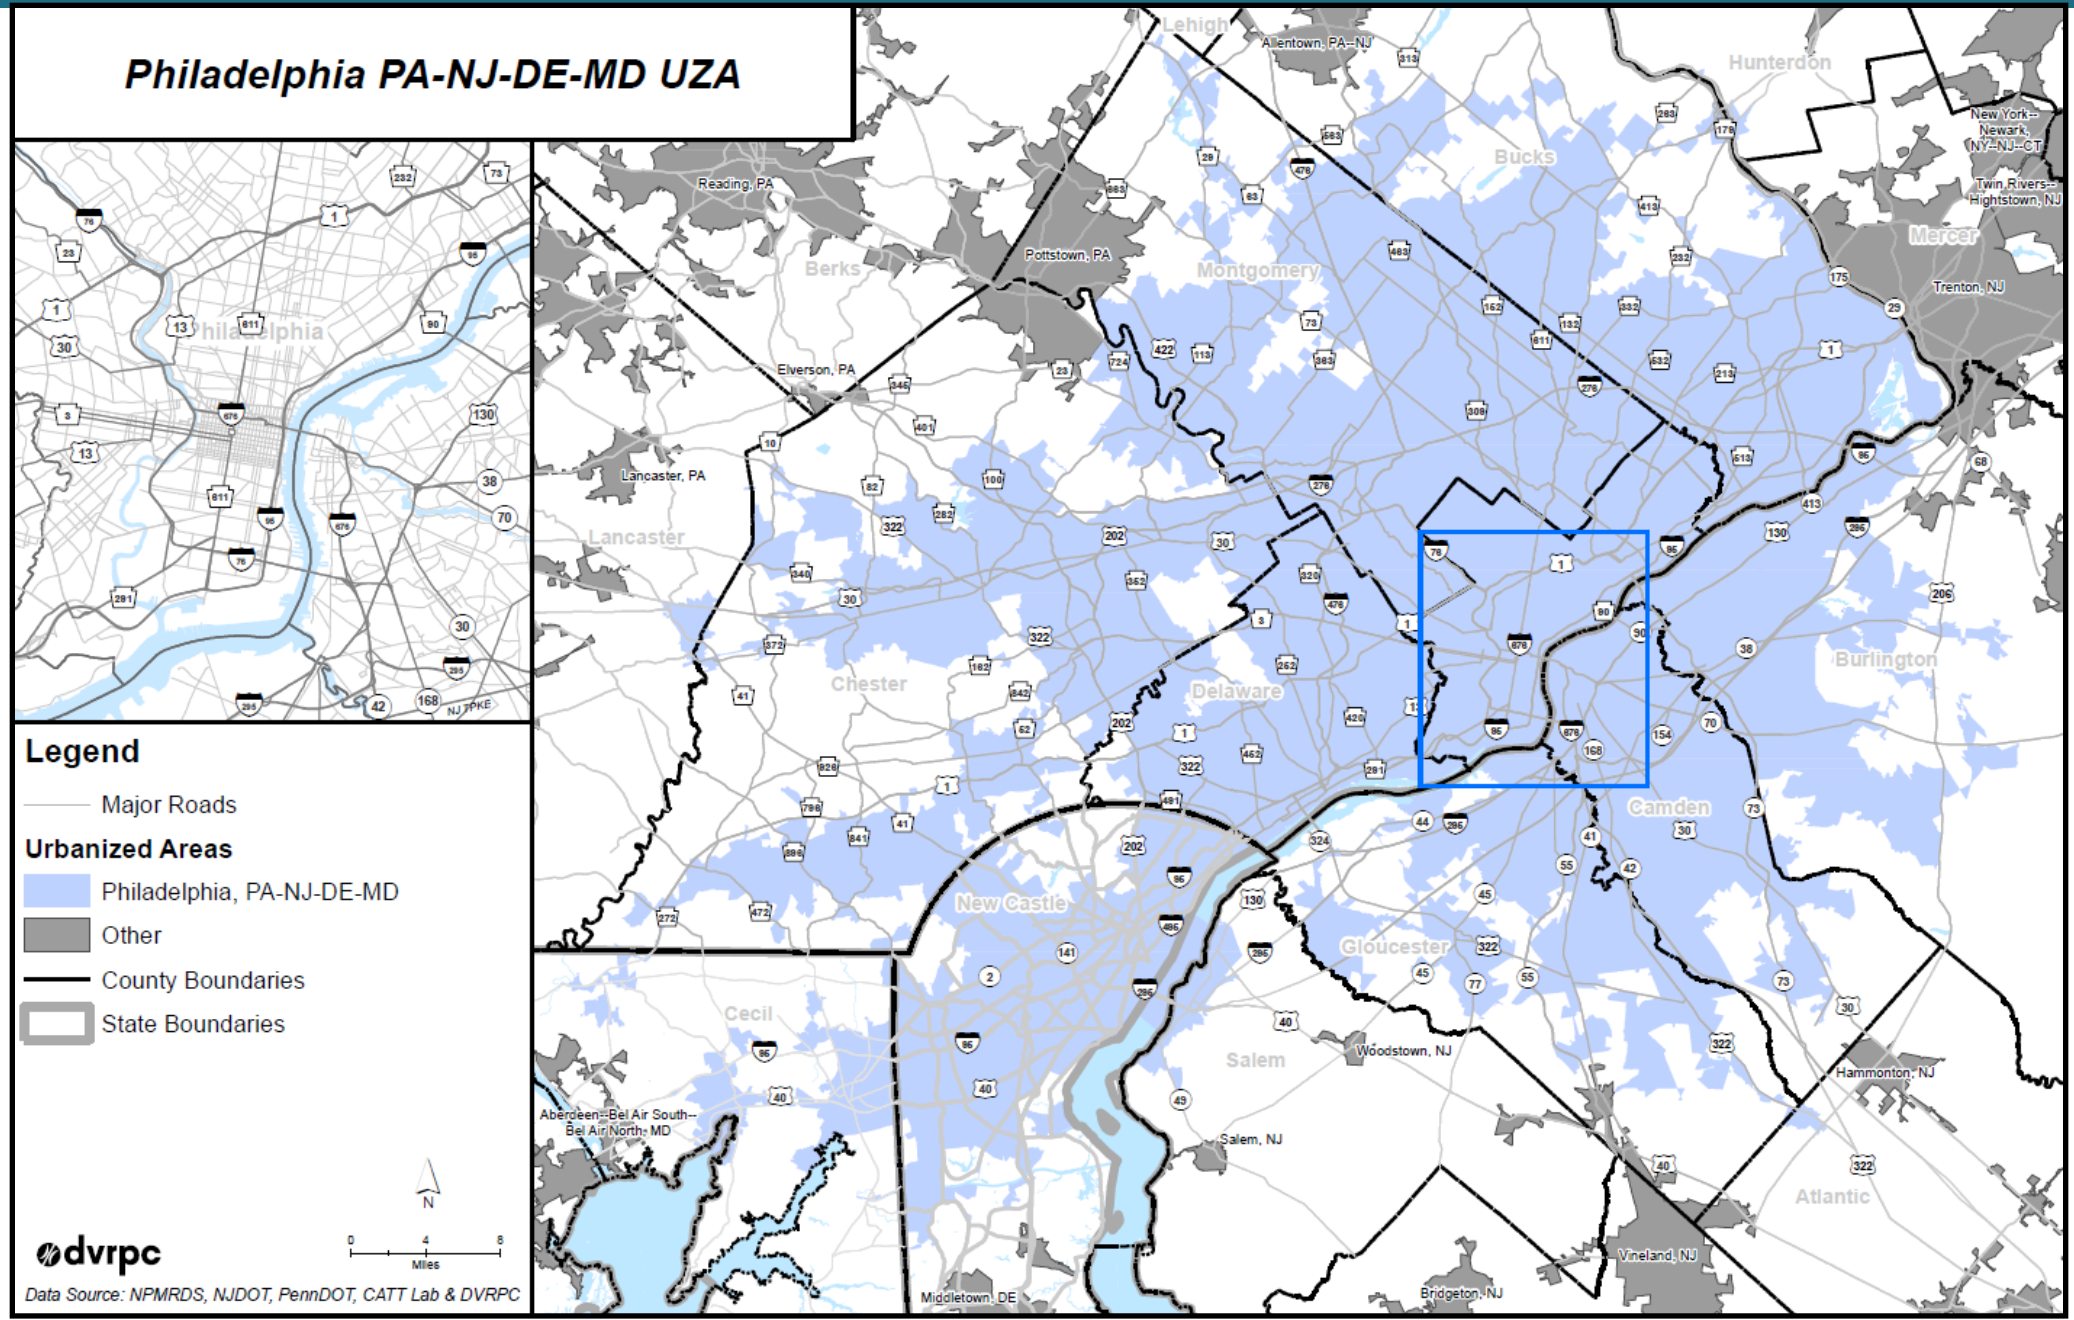

In 2020, 69% of the roadway miles were equally or more reliable compared to 2019

Philadelphia PA-NJ-DE-MD Urbanized Area and Peak Hour Excessive Delay

Urbanized Area

- 4 States
- Parts of 15 Counties
- 4,024 Miles of Roadway

2019 Annual Hours of Peak Hour Excessive Delay (PHED) by County

A Philadelphia has the highest PHED for both interstate and non-interstate

B New Castle County, DE has the 4th highest PHED for non-interstate

2020 Annual Hours of Peak Hour Excessive Delay (PHED) by County

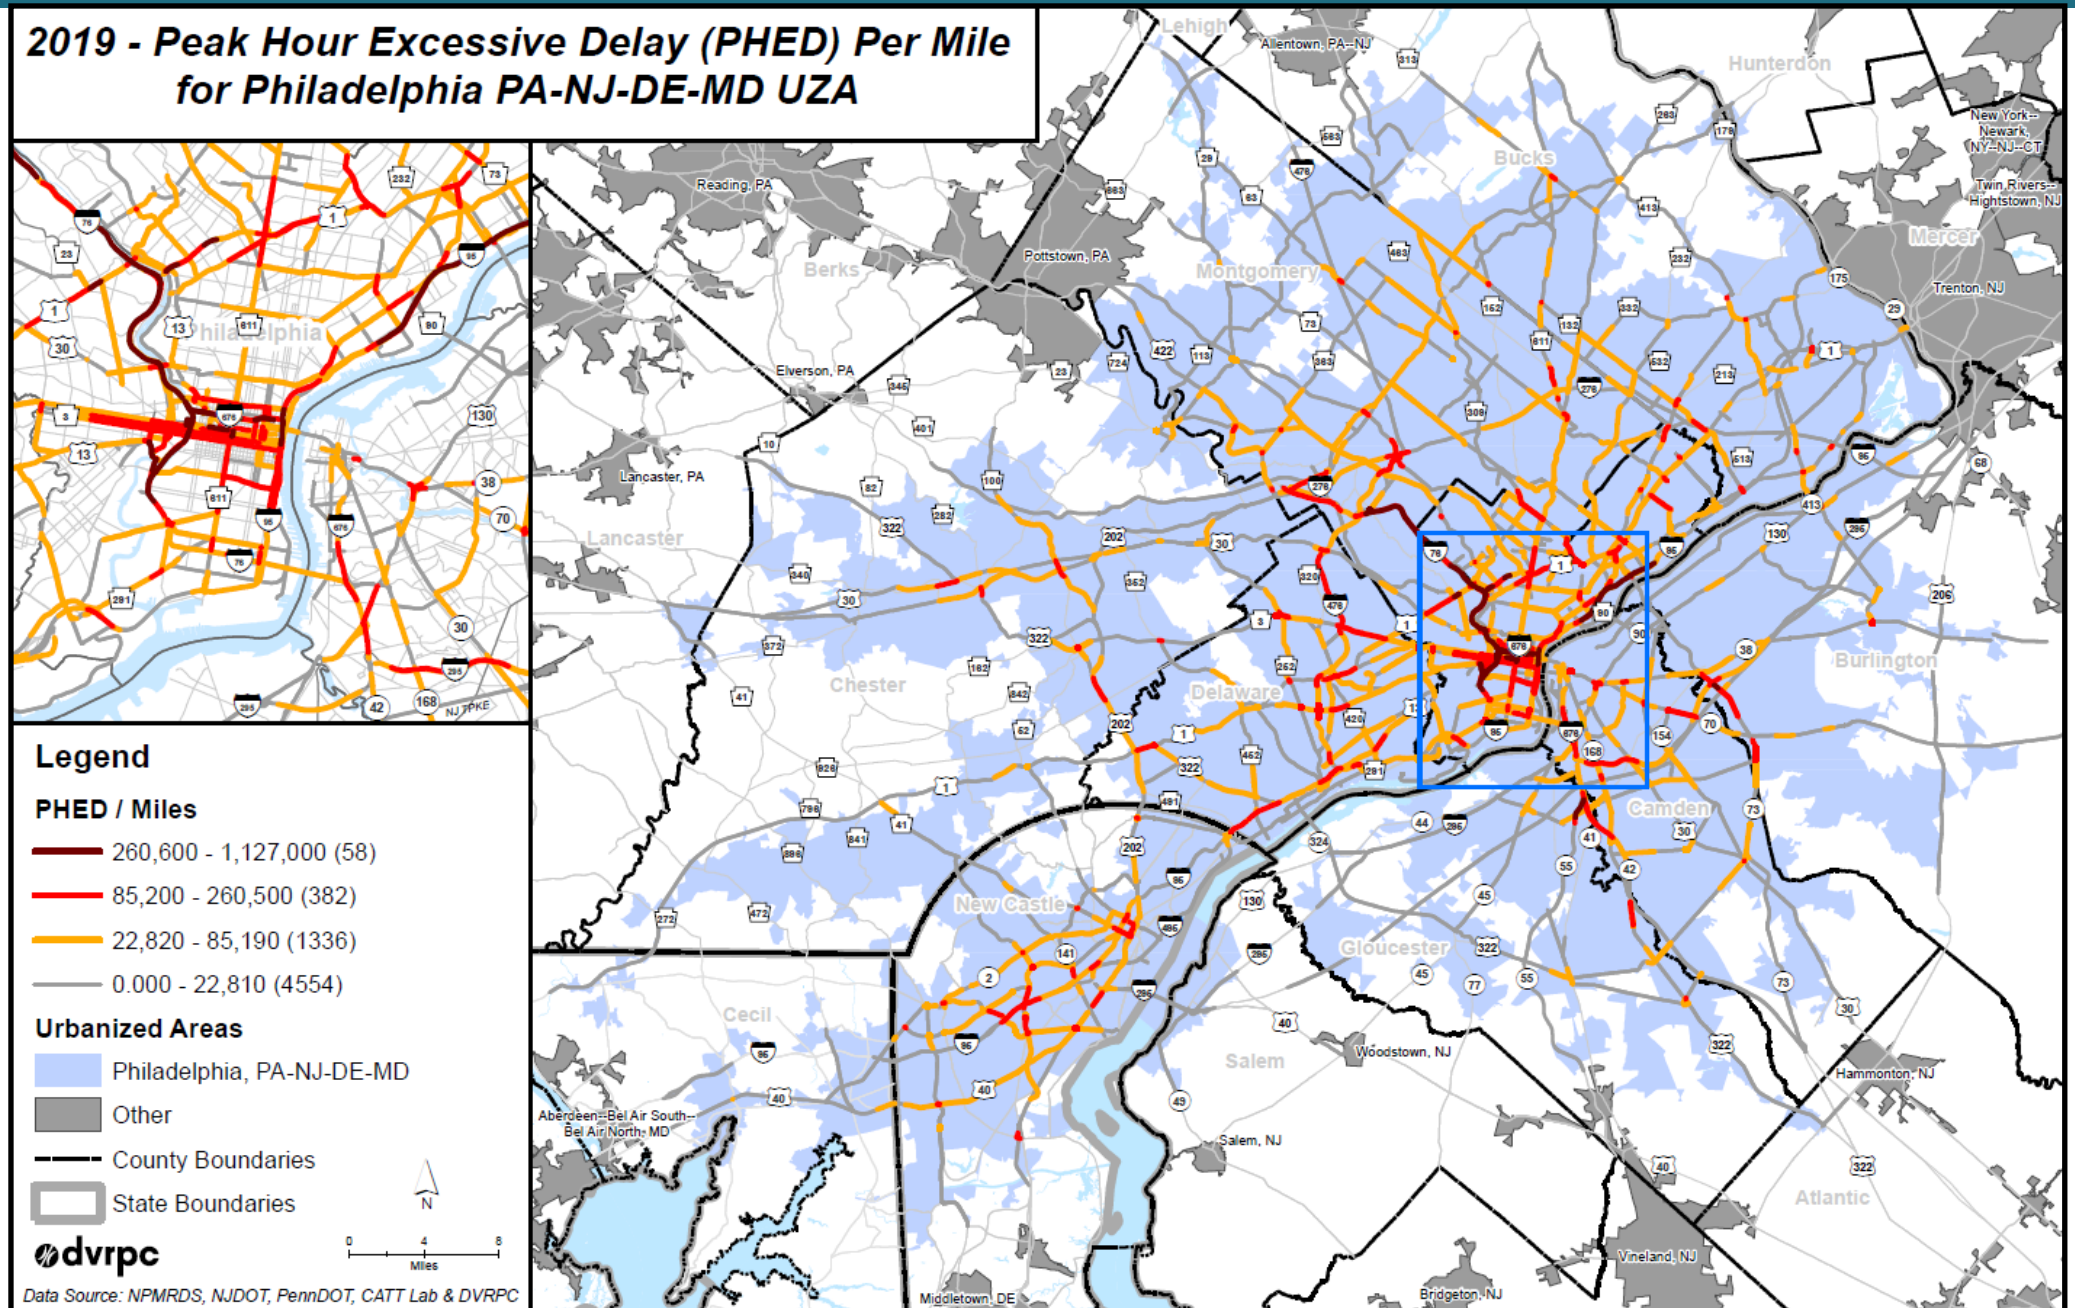

Percent Change Year-Over-Year in Annual Hours of PHED by County

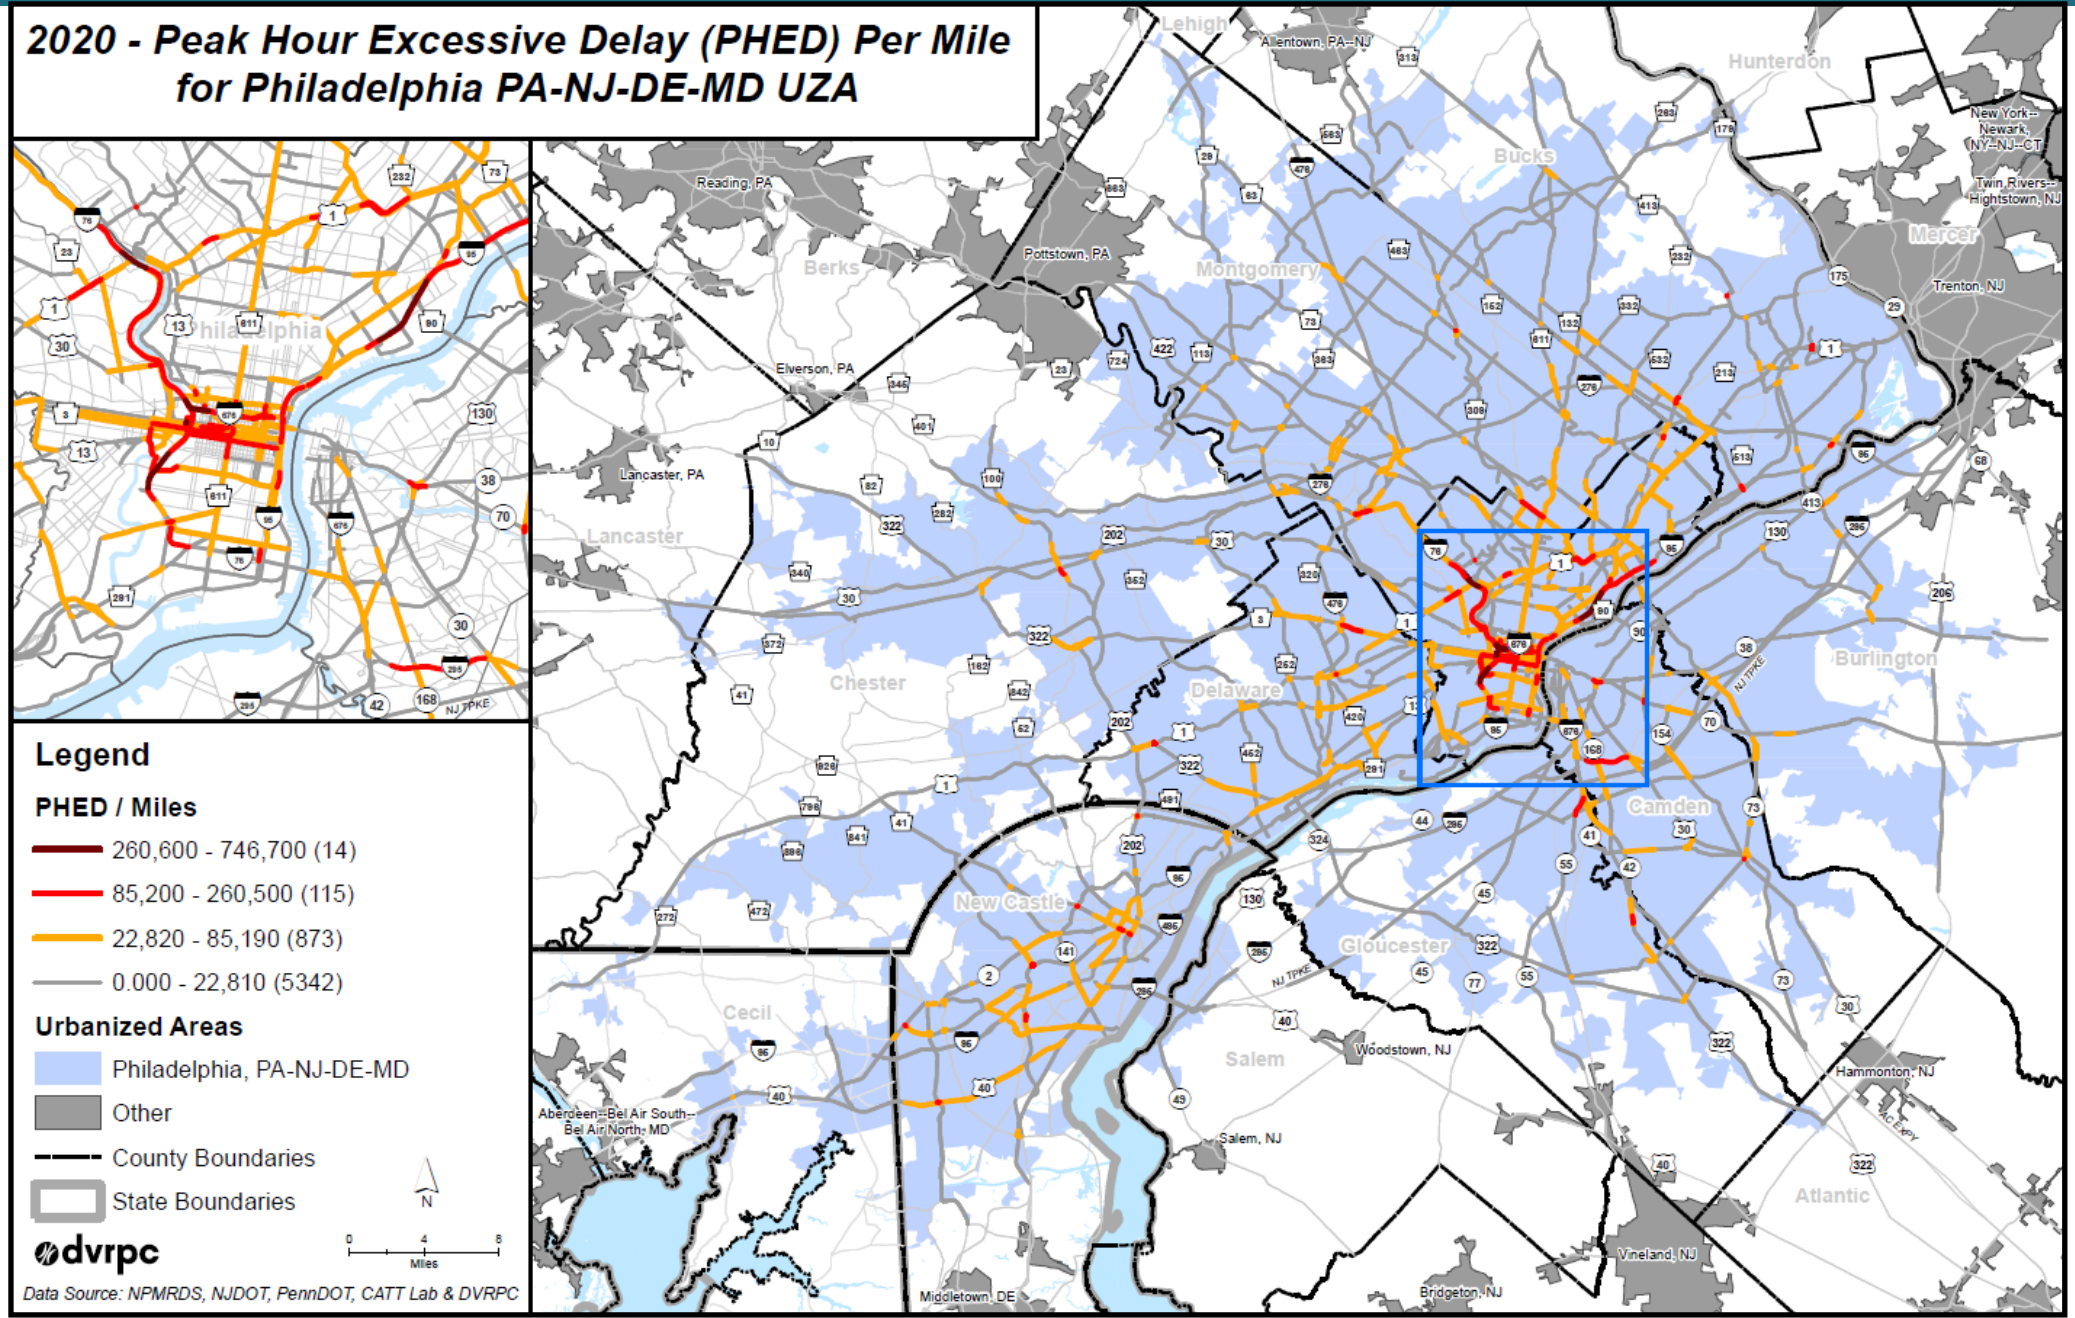

- A** Montgomery County has the most percent decrease for interstates at 72%
- B** Chester County has the most percent decrease for non-interstates at 57%

2019 Peak Hour Excessive Delay Per Mile – Philadelphia PA-NJ-DE-MD UZA

2020 Peak Hour Excessive Delay Per Mile – Philadelphia PA-NJ-DE-MD UZA

Takeaways

- Access to the RITIS-PDA Suite vehicle probe data and tools provides great capabilities to better understand travel trends
- Automating processes using the RITIS API and scripting to collect, manipulate and summarize the results for 500 plus corridors provides efficiencies to analyze the data that would otherwise be much more time consuming
- Performance reports provide a quick means of telling a story about travel trends by corridor that serve as a reference for further detailed studies.

Moving Forward

- Analyze truck travel time reliability and congestion by CMP corridor using the NPMRDS
- Analyze PM3 measures by CMP Corridor:
 - Level of Travel Time Reliability (LOTTR)
 - Truck Travel Time Reliability Index (TTTR); [Interstates Only]
 - Peak Hour Excessive Delay (PHED); [Urbanized Areas Only]
- Better incorporate analyzing traffic events by CMP corridor, including traffic incidents, work zones, adverse weather and special events
- Continually develop and refine performance reports by including traffic events, multimodal performance measures, and mitigation strategies.

Society and Economic Reopening Assessment (SERA)

The **SERA tool** provides data, insight, and decision support on both reopening readiness assessment and post-reopening situational awareness.

More than 20 experts in epidemiology, public health, economics, transportation & mobility, and social sciences at the University of Maryland selected 16 metrics for inclusion in the SERA tool.

Probe Data Analytics Suite

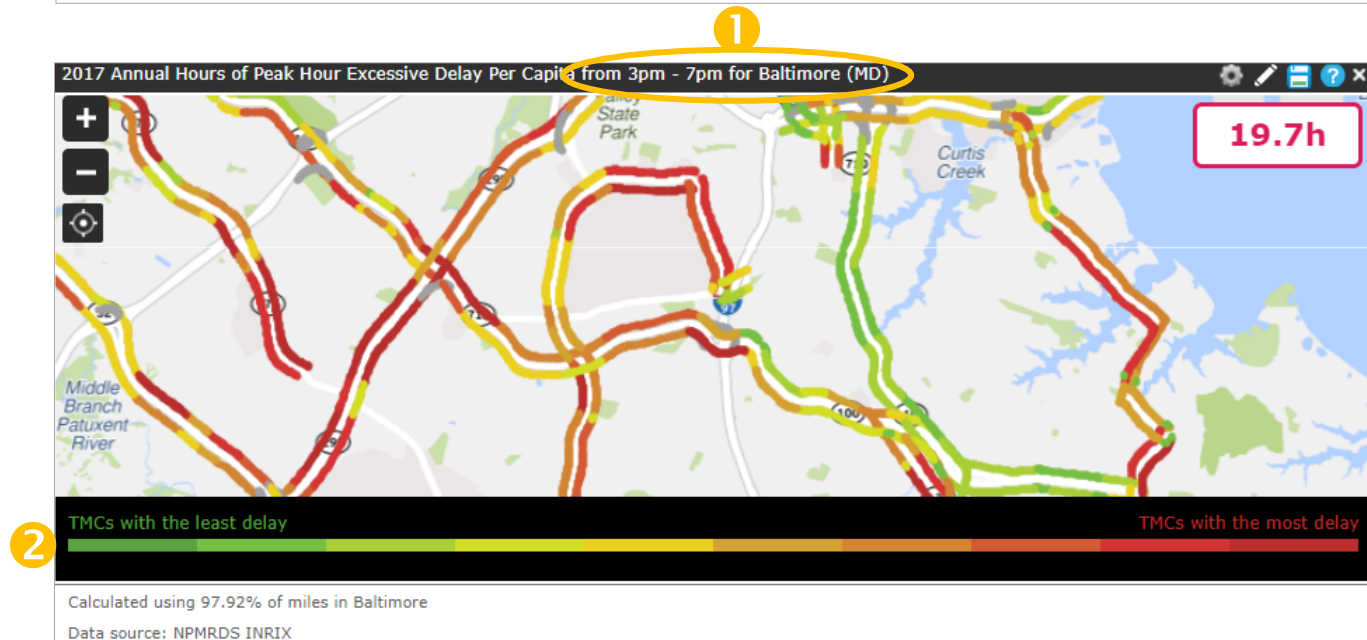

PDA Suite latest updates

1 The default name for **Peak Hour Excessive Delay MAP-21** widgets now includes the selected time of day information, appearing in the header of the widget once the widget is added to the dashboard.

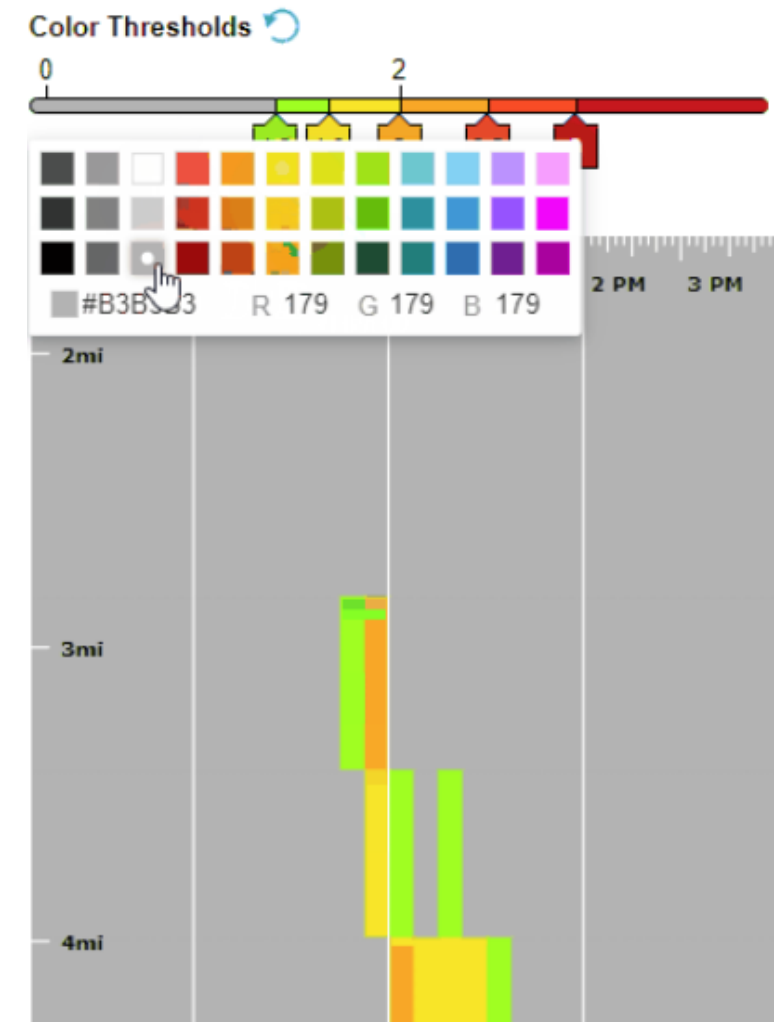

2 The road segments in **Temporal Comparison Maps (PHED)** now use a new default color scheme for better visual contrast.

<https://pda.ritis.org/suite/updates/>

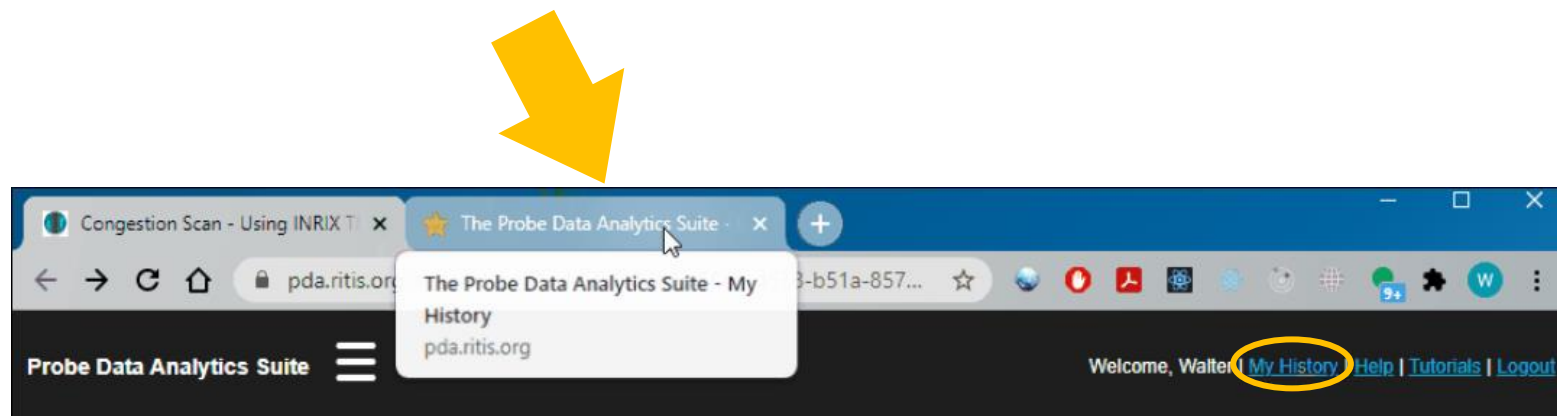

PDA Suite latest updates

① A **custom mouse cursor** now appears when hovering over the color threshold slider in several tools, making it clearer that the color bands can be clicked to allow you to customize the colors used in the visualizations.

PDA Suite latest updates

The **My History** link in the top-right corner of each page will now open in a new browser tab by default, keeping your work tab safe.

2020 PM3 Reports
(due to FHWA June 15, 2021) are complete and ready for evaluation by DOTs and submission to the HPMS PM3 portal.

PM3 Notices, Certification Schedule, and FAQ's

The certification date for 2020 PM3 reports and associated widget reports is March 27, 2021.

This means that 2020 PM3 reports (due to FHWA by June 15, 2021) are complete and ready for evaluation by DOT's and for submission to the HPMS PM3 portal, subject to these considerations:

All state-provided data tables supplied to intake@ritis.org prior to March 27, 2021 have been incorporated into these calculations. If you submitted tables after this date, or if you signed up the RITIS MAP-21 service after this date, please coordinate with support@ritis.org to learn the adjusted certification date for your state.

States may submit new data tables to intake@ritis.org at their convenience any time before May 1, 2021, and will be supplied with a new certification date for that state when ready. Data tables submitted after that date will still be accepted, but please note that at some point in mid- to late May, it may no longer be possible to make changes prior to FHWA's June 15th due date.

As always, states are responsible for reviewing their 2020 reports prior to submission to FHWA. Please inspect for completeness and confirm incorporation of any provided data tables well in advance of June 15th. And lastly, be sure that the calculation timestamp in the metadata.txt file associated with the final version for upload is on or later than the 2020 certification date for your state.

If you have any questions about your state, please contact support@ritis.org.

Maintenance Window

The Probe Data Analytics Suite will be offline from 9AM EDT Saturday, May 22 until 6PM EDT Monday, May 24 for planned hardware maintenance.

Following that, some May 2021 probe data will be unavailable until 6PM EDT Thursday, May 27 due to further maintenance.

RITIS Product Enhancement Working Group Update

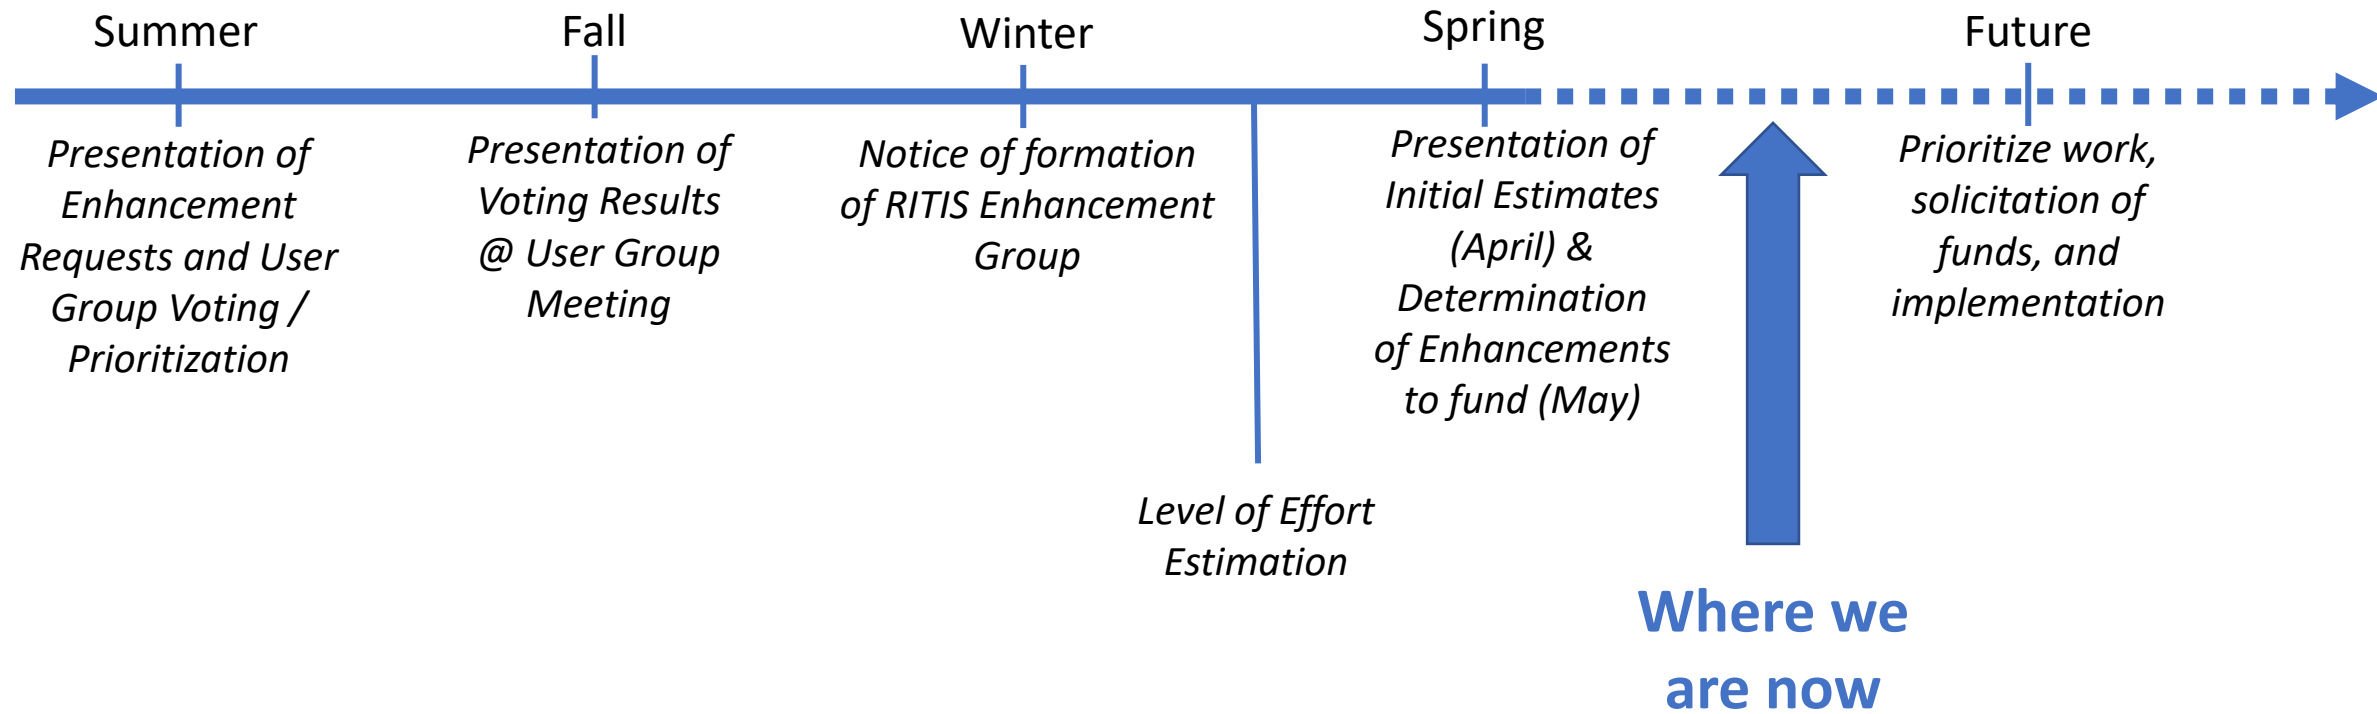

Denise Markow

The Eastern Transportation Coalition
TSMO Director

Purpose & Goals

- Form a nimble “pooled fund” like group to
 - Fund RITIS enhancements
 - Assist with prioritization efforts for the CATT Lab
- Provide stable, annualized funding
- Connect agencies with similar needs

Timeline of Progress

Summary of Highly Requested Enhancements

#	Enhancement	#	Enhancement
1	Customizable Causes of Congestion Pie Chart	13	Advanced Road Selection
2	Support for mobile devices	14	Advanced Time Selection
3	Waze enhancements	15	Road Weather Integration
4	Aerial Photography/Satellite Views	16	DMS on congestion scans
5	Speed Tile Layer Options (congestion, bottlenecks, high-speeds)	17	Custom Color Scales for UDC
6	Road Weather Tiles	18	“My History” notes, editing, and renaming
7	Customization & Filtering of map features (road names, shields, etc.)	19	XD Bottleneck Ranking
8	Map Search Options	20	Embedding of Dashboards & Reports
9	Automated Work Zone Reporting	21	Sharing of Dashboards
10	Safety Data Analytics	22	PDA API Enhancements
11	Historic Media Display Management for Incidents	23	Speed Bins Visualization
12	Focus Mode	24	Corridor Speed Graphs

Top 12 Ranked Enhancements by Group (May 2021)

Top 12 RITIS Product Enhancements

Next Steps...

- Poll results were shared with all Working Group members
- Agencies that have funds available for FY2021 discussed enhancements and placed their votes by May 14th
- An update will be provided at the upcoming RITIS User Group meeting in July 2021
- Next Meeting of this Working Group: October 2021 for FY2022

Corridor Performance Report

Use this template to create a report that describes the performance of a corridor over a selected time periods (quarterly, yearly) and compares that performance with previous periods.

Overview

- Click to download the PowerPoint template to create a report that describes the performance of a corridor over the course of a year and compares that performance with previous years. Additional design resources are also available.
- Download Agency Use Case examples below to see how other agencies have used these templates or have created similar reports using content from RITIS.
- Scroll down to learn how to create this report or click on the 'How To Create Report' in the navigational menu.

• US Route 40 / Harford County, MD

Tools Used In This Report

- Performance Charts**: Visualize performance metrics in a variety of charts - line, bar, candlestick, etc.
- Congestion Scan**: Analyze conditions on one or more stretches of roads or corridors.
- Performance Summaries**: Produce reports of seven different performance metrics for different time periods (each day of week, all weekdays, etc.)
- Microsoft Powerpoint**: Used to edit images and present report.
- (Optional) Microsoft Excel**: Used with PDA Performance Summaries to generate reports.
- (Optional) Google Earth Pro**: Used to create a background map image.

Design Recommendations To Keep In Mind

We've strived to make the Guides simple and easy to understand, but if you have any questions or need help, please contact us at support@rits.org. To start off, we think these abbreviated Lessons Learned from FHWA's Performance Reporting Prototype Technical Report are very instructive and important to keep in mind.

- ☒ **Tailor report content and format to engage and inform your audience**
 - Keep reports for the general public engaging and simple
 - Reserve greater complexity for professional transportation audience
 - Consider how the audience experiences transportation - the general public typically doesn't care about agency business process silos
- ☒ **Relevant, easy-to-understand graphics are likely to be shared**
 - "Single issue, single page" graphics-heavy infographics are a valuable tool to draw in a larger audience
- ☒ **Snapshots are not enough**
 - Make sure to include trends and contextual information
 - Link to actions being taken by the organization
- ☒ **Don't emphasize appearance over effectiveness**
 - Information should be conveyed clearly and concisely
 - Simplicity over embellishment is usually best
- ☒ **Tell a story so the data comes alive**
 - The story must be delivered at the right technical level for the audience and targeted on an area of interest

How to Create the Corridor Performance Report

Click on each numbered box below to learn how to create the content in each section and how we used RITIS to generate charts and produce performance data.

Template one-pagers

After-Action Review (Original one-pager option)

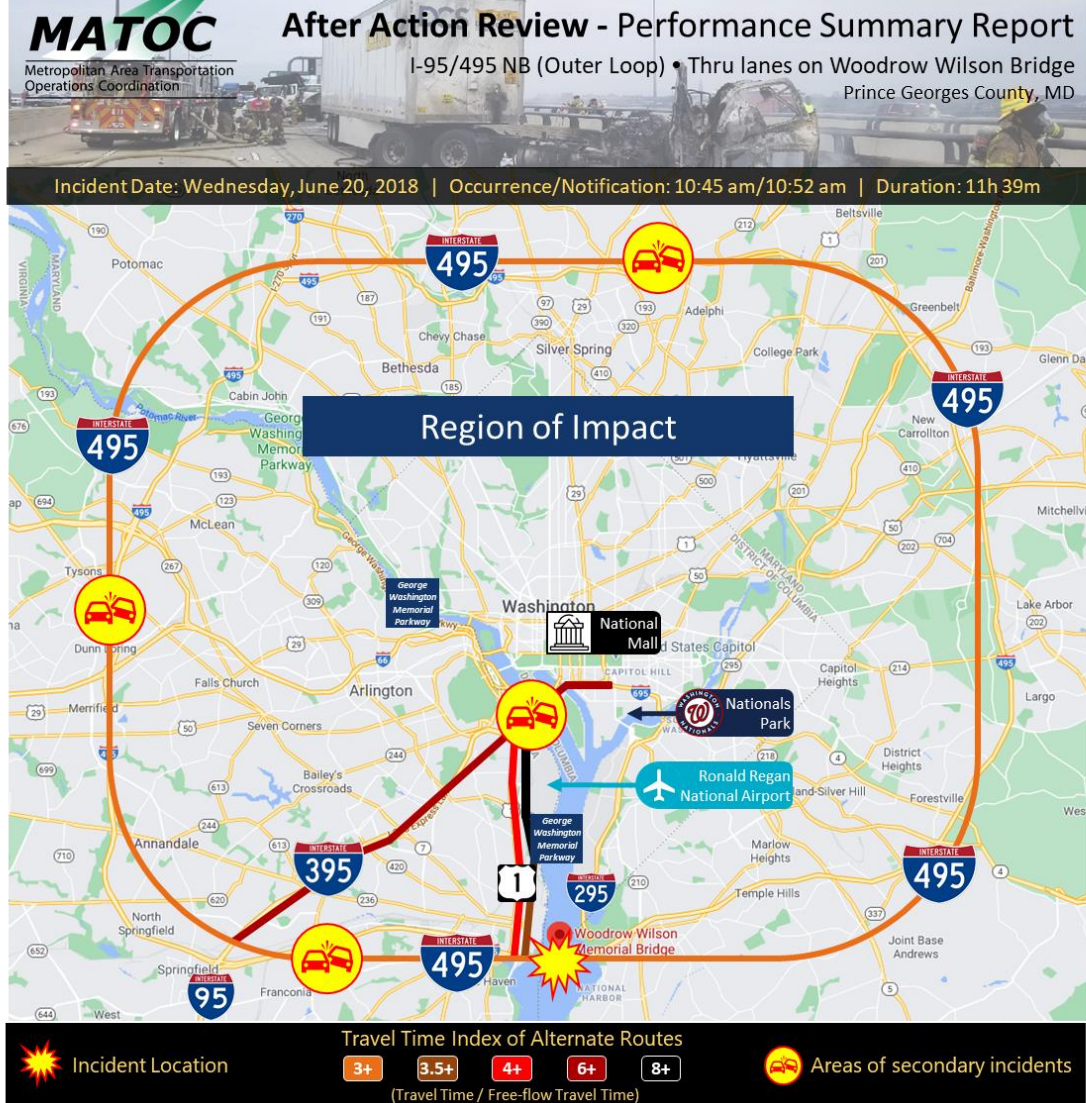

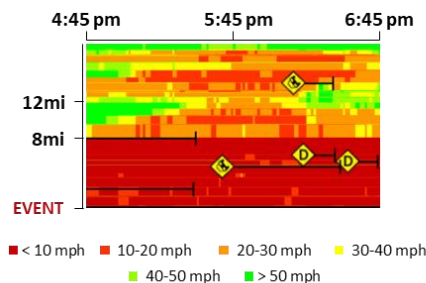

Event Summary

A tractor trailer hit several construction vehicles on the Woodrow Wilson Bridge, leading to a closure of the Capital Beltway (primarily NB). The tractor-trailer and three other vehicles caught fire. There was 1 fatality, 7 treated & released, 1 hospitalized. A work crew trapped below the bridge had to be rescued.

Some Key Aspects

Backups of 8 miles were common, increasing at times to 12 miles. There were numerous minor secondary incidents in the queued traffic (worst hours shown below).

Lane Status

Due to the extensive recovery & cleanup operations required (hampered by late afternoon/ early evening rain), the NB Outer Loop thru lanes were closed for most of the day - from 11:03 AM to 9:23 PM (10h 20m).

User Delay Cost Comparisons

Other Regional Impacts

Significant Impacts were also felt around **Ronald Reagan Washington National Airport**, Alexandria, the District of Columbia, major transit corridors (particularly along Route 1) and two planned events in the area:

Event Summary Vehicle Collision & Fire on the Woodrow Wilson Bridge

Occurred on the I-95/495 NB Outer Loop in Prince Georges County, MD • Wednesday, June 20, 2018

The incident occurred at about 10:45 AM, with traffic back to normal about 10:31 PM.

A tractor trailer hit two utility vehicles on the Woodrow Wilson Bridge.

The I-95/I-495 NB Outer Loop on the bridge was closed for 10 hr. 20 min.

17 agencies and over 100 responders actively participated in this operation.

One of the utility vehicles caught fire from a fuel leak.

A work crew trapped below the bridge had to be rescued.

There were 12mi backups NB into VA, and 4mi backups SB into MD.

Injuries included:

- 1 fatality
- 1 hospitalized
- 7 treated & released

3x to 8x

Increase in **travel time** on alternate routes for the day of the accident vs typical free-flow conditions.

59K – 74K
(232% - 338%)

Increase in **vehicle-hours of delay** for the region on the day of the accident vs normal June Wednesdays.

\$1.79M - \$2.22M
(232% - 338%)

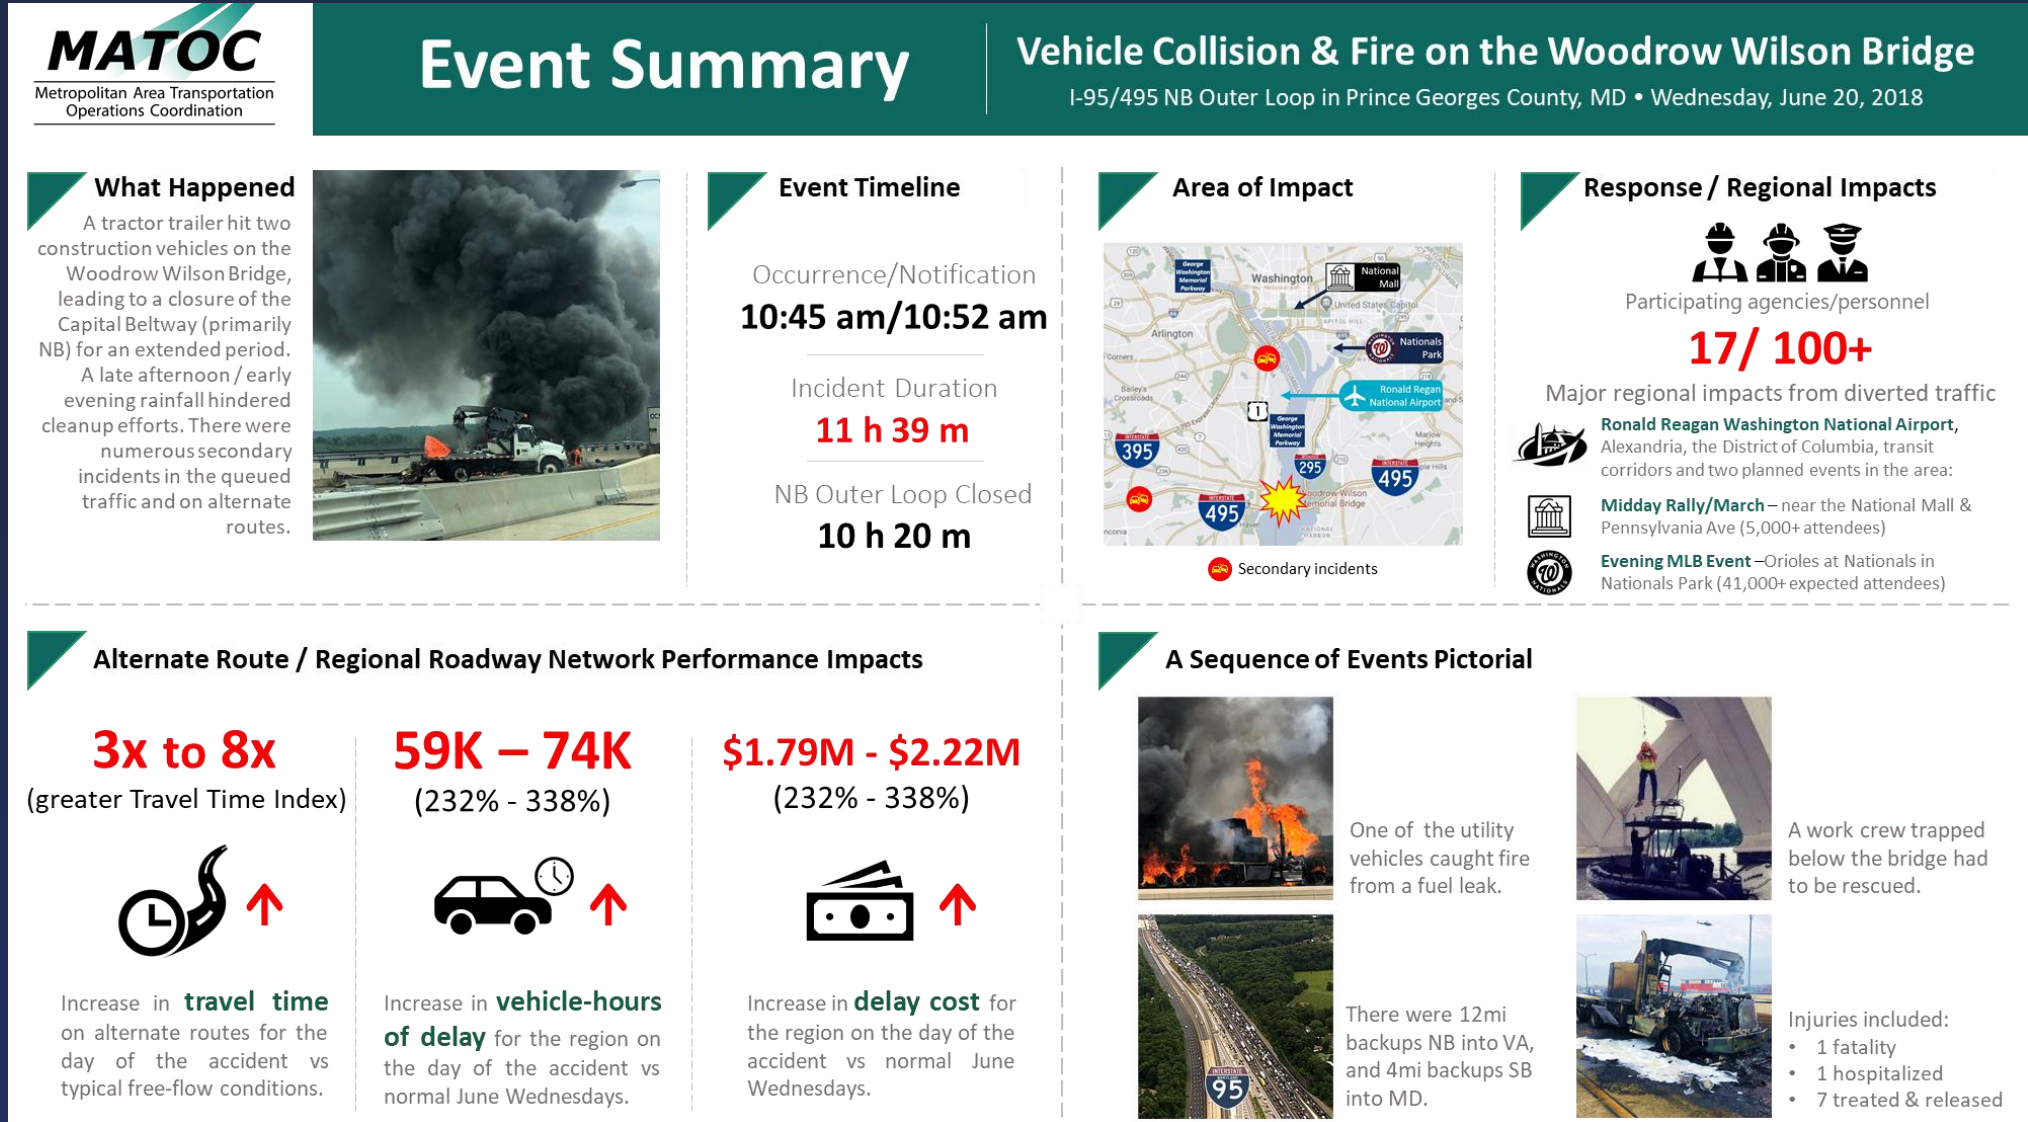

Increase in **delay cost** for the region on the day of the accident vs normal June Wednesdays.

2 One-pager options After-Action Review (Infographic style)

2 One-pager options After-Action Review (possible flip side)

Secondary Incidents

A significant number of secondary incidents occurred in the area, primarily due the stop-and-go nature of the queued traffic at the incident site and heavy congestion on alternate routes used to bypass the WWB closure.

Select example increases in travel time on alternate routes for the day of the accident compared to typical free-flow conditions.

Travel Time Index (TTI) Comparisons

I-495 (Capital Beltway)

US-1 (VA, from I-495 to I-395)

I-395 (from 3rd St. Tunnel to I-495)

George Washington Memorial Pkwy. (from Slater Ln. to I-395)

Speed: The current estimated harmonic mean speed for the roadway segment in miles per hour.

Buffer Time: The extra time (or time cushion) that travelers need add to their average travel time when planning trip to ensure on-time arrival (50% Travel Time - Average Travel Time).

Buffer Index: The buffer index is expressed as a percentage of the value threshold at reliability per vehicle (50% Travel Time - Average Travel Time) / Average Travel Time. For example, a buffer index of 1.00 percent means that for a 20-minute average travel time, a traveler should budget an additional 2 minutes (20 minutes x 10 percent = 2 minutes) to ensure on-time arrival most of the time.

Planning Time: How much total time a traveler should allow to ensure on-time arrival (Average Travel Time + Buffer Time).

Planning Time Index: The total travel time that should be planned when an adequate buffer time is included (50% Travel Time + Buffer Time). The planning time index differs from the buffer index in that it includes typical delay as well as unplanned delay. Thus, the planning time index considers both road conditions and a 15-minute delay in traffic. For example, a planning time index of 1.00 means that for a 15-minute trip in traffic, the total time that should be planned is 30 minutes (15 minutes x 1.00 = 30 minutes).

Travel Time: Time it will take to drive along the roadway segment (Distance Traveled / Speed).

Travel Time Index: Travel time represented as a percentage of the ideal travel time (Travel Time / Free-flow Travel Time).

Data Sources

TMC data is used here to show that there wasn't much change in conditions on the corridor pre and post Covid-19 shutdowns. The data used for before after data was March 16th when the bulk of the closures occurred. The following congestions scans show data before and after the shutdowns. It's use here is beneficial to see before/after Covid-19 shutdowns. For the rest of this document INRIX XD will be utilized.

Speed for US-40 using INRIX data

Averaged by 1 hour for January 01, 2020 through March 13, 2020 (Every weekday) and June 2020 (Every weekday)

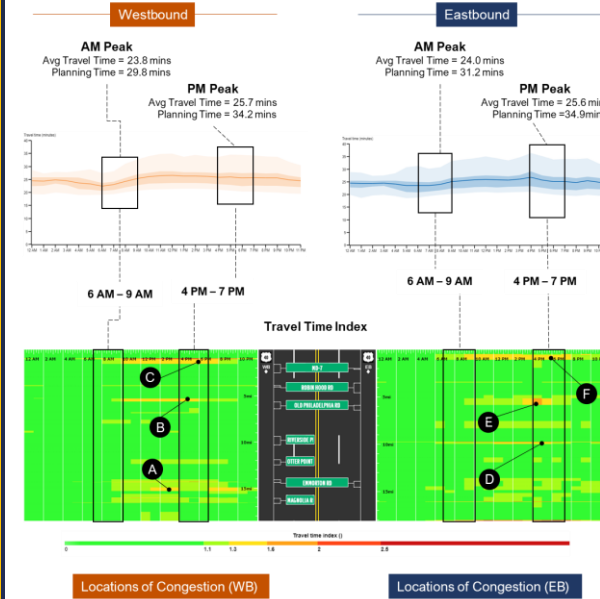

Travel time index for US-40 using INRIX data

June 2020 Corridor Travel Times

Weekday travel times for the US-40 corridor were aggregated over the entire month of June (weekdays) and are presented below. This corridor exhibits a fairly flat travel time regardless of time of day. AM peak travel times are slightly lower than mid day or PM peak. In each direction, travel times are virtually the same. The PM peak travel times are generally around 2 minutes longer than the AM peak. The heat map at the bottom of the page shows the geographic location of typical congestion through the day.

Location A: US-40 WB Emmorton Rd to Mountain Rd

Speed Limit: 45 mph

Lanes: 2 WB. Becomes 3 lanes at the Extra Space Storage driveway on the approach to MD-152

Signalized intersections:

- 1 Paul Martin Dr
- 2 Gateway Dr
- 3 Mountain Rd

Time of Day with most Congestion
1 - 4pm

Notes: Edgewood Business District. Mostly commercial

Project Assessment Report

M006017: Concrete Rehabilitation
I-75 from SR 54 to Walt Stephens Rd

Project Background/Description

Concrete Rehabilitation on I-75 is currently in progress from SR 54 / Jonesboro Rd to Walt Stephens Rd. During this time, temporary road closures spanning no longer than 2 miles occur along the pavement. Construction is estimated to conclude in June 2021.

Key Aspects

- 6.2 Mile Length
- Clayton, Henry Counties
- Est Completion: 06/21

Project Location Map

Project Corridor
Signalized Intersections
Non-Signalized Intersections

Project Timeline

CATT Lab Performance Reporting

Performance Results

Speed

With a majority of construction occurring in the Southbound lanes, there has been an increase of congestion, especially during the PM Peak. Northbound lanes show little effect.

Bottlenecks

Northbound bottlenecks showed little change, as compared to Southbound. Although the length increased, the average congestion time decreased by approximately 20%.

Key Bottleneck Improvement

	Before (Oct 2019)	After (Oct 2020)	Δ Difference
I-75 Southbound at I-675			
Bottleneck Length (miles)	1.78 mi	1.98 mi	↑ 0.2 mi (10.6%)
Total Congested Time (Daily)	0 h 22 m	0 h 18 m	↓ 0 h 4 m (20.0%)

Reliability

Shown for both directions, I-75 has seen an increase in travel time. Buffer time and planning time has increased, meaning drivers need to leave earlier to get to their destination on time!

Travel Time

6.4%
Change in weekday travel time

Buffer Time

27.4%
Change in weekday buffer time

Planning Time

92.3%
Change in weekday planning time

Delay Costs

Due to the increase of construction, user delay cost has seen isolated spikes, resulting in a higher average.

Before & After User Delay Cost Detail

Measure	Before (Oct 2019)	After (Oct 2020)	Δ Difference
User Delay Cost (Dollars)	\$338,504	\$376,476	↑ \$37,972 (10.6%)
Hours of Delay (Person-hours)	15,272 h	13,731 h	↓ 1,540h (10.6%)
Delay per VMT (minutes/mile)	0.0155 min/mi	0.0138 min/mi	↓ 0.0017 min/mi (11.6%)

3 Test Drive Pedestrian Hit & Run (GDOT)

Event Summary

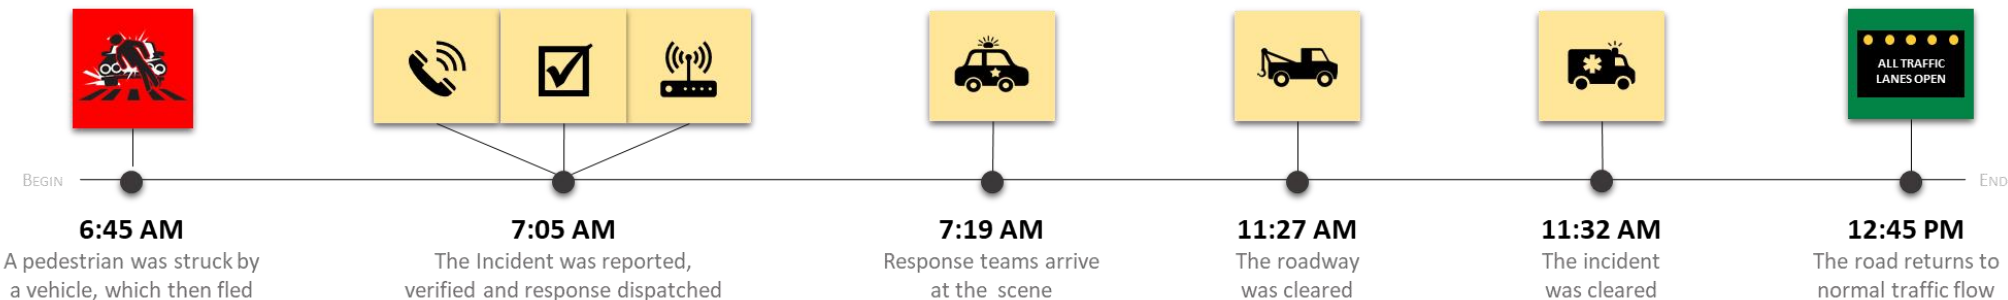

Pedestrian Hit & Run

I-75 NB near Exit 239 (CW Grant Pkwy.) | December 9, 2019

On Monday morning, December 9, 2019, a pedestrian was hit and killed on I-75, resulting in four hours of road closures and gridlock through the Southside. The northbound lanes were shut down at C.W. Grant Parkway about 7:30 AM for authorities to conduct an investigation. Traffic began flowing again about 11:30 AM. Tough delays remained out of Morrow through the lunch hour.

Incident Timeline | Total Elapsed Time: 6 hours

Timeline Detail 🔍

7:05 AM Clayton Police first received a report of a pedestrian struck by a motor vehicle

7:19 AM Clayton PD arrived on scene

7:26 AM TMC was advised of incident from Clayton PD and found a camera visual

7:30 AM All lanes were blocked; confirmed fatality

7:36 AM Traffic was diverted to I-285, messages posted

7:41 AM Georgia State Patrol (GSP) on scene and assisting with traffic control

8:06 AM Incident confirmed as a hit & run; GSP, Clayton PD, the Fire Department, GBI, HERO, and the Coroner are all on scene

10:26 AM Coroner removed the deceased from the scene

11:06 AM GBI is clear

11:20 AM Fire clears scene

11:25 AM HERO opens lanes to traffic

12:12 PM Traffic returned to normal flow

Traffic Impact 🚗

During the investigation, major delays stretched back more than six miles. At their worst, the trip from Mt. Zion Boulevard to I-285 clocked in at nearly four hours.

TIM Timeline | Total Elapsed Time: 5h 07m

Timeline Detail 🔍

T₀ Clayton Police estimated that the incident took place around **6:45 AM**

T₁ They were the first agency notified at approximately **7:05 AM**

T₂ (Skipped)

T₃ Officer dispatched at **7:10 AM**

T₄ PD arrived on scene at **7:19 AM**
 — The NB lanes were closed at **7:30 AM**

T₅ The roadway was cleared at **11:27 AM**

T₆ The incident was officially closed at **11:32 AM**

T₇ Traffic returns to free flow conditions at **12:45 PM**

Traffic Impact 🚗

During the investigation, major delays stretched back more than six miles. At their worst, the trip from Mt. Zion Boulevard to I-285 clocked in at nearly four hours.

3 Test Drive Pedestrian Hit & Run (GDOT – flip side)

Performance Impacts

Performance Chart for I-75 NB
between Cleveland Ave/Exit 241 and I-675/Exit 227

(Above) At 7:55 AM, weekday speeds for the year averaged **41.2 mph**, while during the course of the investigation, speeds dropped to **3.9 mph**.

Those stuck in the backups were eventually turned around and diverted off the interstate onto I-285 East. Commuters were crowding onto I-675, Old Dixie Highway and Jonesboro Road throughout the morning drive.

Congestion Scan for I-75 NB
between I-285/Exit 238 and I-675/Exit 227

(Above) Comparisons between the incident date and the Monday before and Monday after show dramatic speed reductions and traffic queuing differentials due to the investigation.

(Right) Data from GEARS and Navigator show the primary (red dot) and secondary (black dots) incidents that occurred. Note the three secondary incidents that occurred between 9 a.m. and 10:00 a.m. at the back of the queue (black arrows).

3 Test Drive I-76 Corridor Performance Report (DVRPC)

2020 Corridor Travel Times and Congestion

Weekday travel times for this portion of the I-76 corridor were aggregated over the entire year. During the PM peak period, the eastbound direction indicates a higher peak average travel time compared to the westbound direction, or about 2.5 minutes longer. In the eastbound direction, the PM peak travel times and planning times are consistently higher than the AM times. The average PM peak travel time is about 3.5 minutes longer than the AM period travel time, and the planning time is approximately 9 minutes longer. This is due in part to expanded job opportunities in the King of Prussia and Conshohocken areas farther west and City residents commuting back home from work. The heat map at the bottom of the page shows the geographic location of typical congestion through the day.

Locations of Typical Slow Downs (EB)

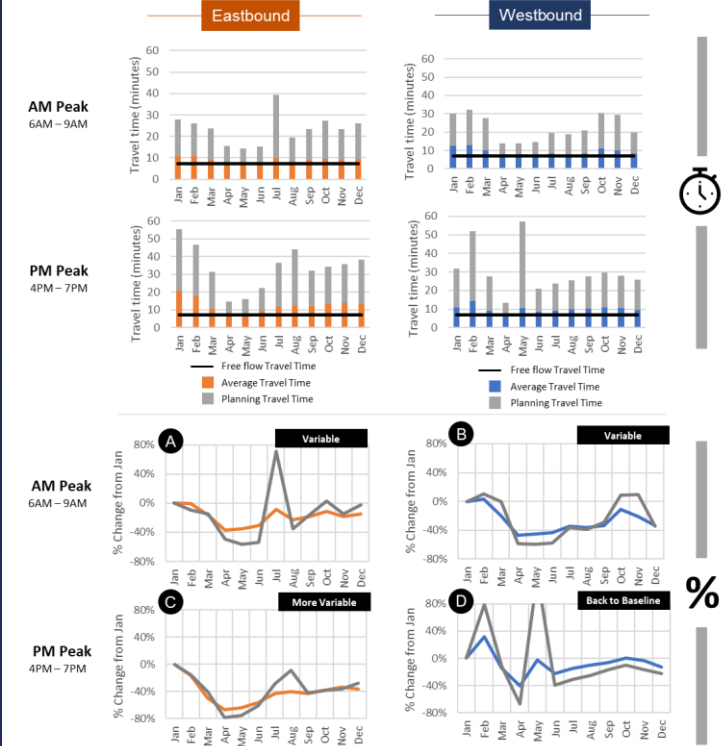

Locations of Typical Slow Downs (WB)

A: 3PM – 6PM : Matsonford Rd to Hollow Rd
B: 4PM – 5PM : Hollow Rd to Belmont Ave

C: 6AM – 8AM : US 1 to Belmont Ave
D: 1PM – 5PM : US 1 to Belmont Ave
E: 1PM – 3PM : Belmont Ave to Hollow Rd
F: 2PM – 5PM : Hollow Rd to Matsonford Rd

2020 Changes in Travel Times

How did travel times change over the course of 2020? This depends on time of day and direction of travel. The bar charts show monthly travel times by peak period and direction. The line charts show the percentage change in travel times and planning times as compared to a January 2020 baseline. The percent change in travel times has not exceeded the January baseline since February as a result of the pandemic.

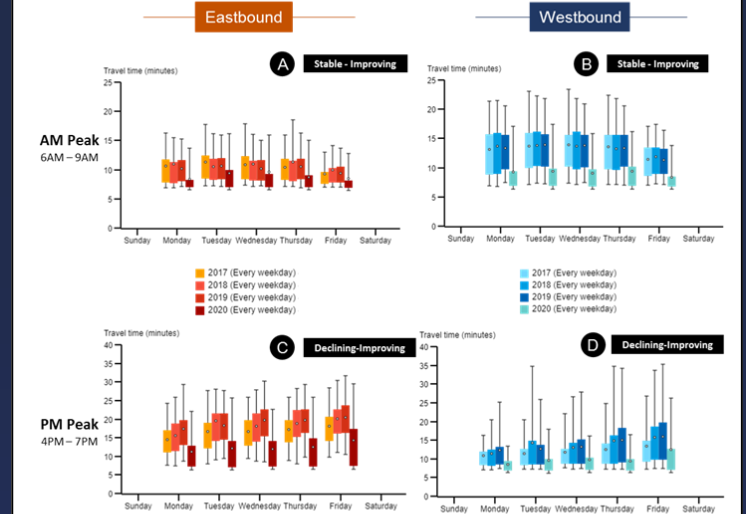

Observations

1. In the eastbound AM peak period, travel times decreased from Feb to Apr and then gradually increased through the analysis period. 2. In the westbound AM peak, there was a sharp decline in travel time from Feb to Apr and then gradually increased through Oct, but then declined through Dec. 3. Travel times in the eastbound direction during the PM peak declined sharply from Jan to Apr (60%), and then gradually increased through Dec. 4. Travel times in the westbound direction during the PM peak declined from Feb to Apr, and then remained relatively flat through the end of the year, while approaching baseline conditions.

Comparison with previous years

How much did travel times change compared to previous years? In the AM and PM peak periods, average travel times and travel time reliability were fairly constant from 2017 to 2019. However, there were significant improvements in travel times and reliability in 2020 as a result of the pandemic.

1. During the AM peak period in the eastbound direction, travel times and reliability remained relatively constant from 2017 to 2019 but improved significantly in 2020. 2. The same is true for the westbound direction, but the travel times were higher and less reliable. 3. During the PM peak period in the eastbound direction travel times progressively increased and reliability decreased from 2017 to 2019, but improved significantly in 2020. 4. The same holds true for the westbound direction with the exception of lower travel times and in some instances more variability in travel.

The box plot presents a simplified distribution of the range of travel times throughout the period of interest, based on percentiles.
